List of Figures	xvii
List of Tables	xxiii
Preface	xxv
I Basic concepts of linear optimization	I
1.1 The company Dovetail	2
1.1.1 Formulating Model Dovetail	2
1.1.2 The graphical solution method	3
1.2 Definition of an LO-model	5
1.2.1 The standard form of an LO-model	5
1.2.2 Slack variables and binding constraints	9
1.2.3 Types of optimal solutions and feasible regions	10
1.3 Alternatives of the standard LO-model	12
1.4 Solving LO-models using a computer package	14
1.5 Linearizing nonlinear functions	16
1.5.1 Ratio constraints	16
1.5.2 Objective functions with absolute value terms	17
1.5.3 Convex piecewise linear functions	19
1.6 Examples of linear optimization models	21
1.6.1 The diet problem	22
1.6.2 Estimation by regression	24
1.6.3 Team formation in sports	26
1.6.4 Data envelopment analysis	29
1.6.5 Portfolio selection; profit versus risk	34
1.7 Building and implementing mathematical models	39
1.8 Exercises	42
I Linear optimization theory: basic techniques	
2 Geometry and algebra of feasible regions	51
2.1 The geometry of feasible regions	51

2.1.1	Hyperplanes and halfspaces	52
2.1.2	Vertices and extreme directions of the feasible region	55
2.1.3	Faces of the feasible region	58
2.1.4	The optimal vertex theorem	60
2.1.5	Polyhedra and polytopes	62
2.2	Algebra of feasible regions; feasible basic solutions	63
2.2.1	Notation; row and column indices	63
2.2.2	Feasible basic solutions	64
2.2.3	Relationship between feasible basic solutions and vertices	68
2.2.4	Degeneracy and feasible basic solutions	75
2.2.5	Adjacency	77
2.3	Exercises	79
3	Dantzig's simplex algorithm	83
3.1	From vertex to vertex to an optimal solution	83
3.2	LO-model reformulation	89
3.3	The simplex algorithm	91
3.3.1	Initialization; finding an initial feasible basic solution	92
3.3.2	The iteration step; exchanging variables	92
3.3.3	Formulation of the simplex algorithm	95
3.4	Simplex tableaus	96
3.4.1	The initial simplex tableau	99
3.4.2	Pivoting using simplex tableaus	99
3.4.3	Why the identity matrix of a simplex tableau is row-permuted	104
3.5	Discussion of the simplex algorithm	106
3.5.1	Simplex adjacency graphs	107
3.5.2	Optimality test and degeneracy	110
3.5.3	Unboundedness	112
3.5.4	Pivot rules	114
3.5.5	Stalling and cycling	115
3.5.6	Anti-cycling procedures: the perturbation method	118
3.5.7	Anti-cycling procedures: Bland's rule	120
3.5.8	Correctness of the simplex algorithm	121
3.6	Initialization	122
3.6.1	The big-M procedure	123
3.6.2	The two-phase procedure	127
3.7	Uniqueness and multiple optimal solutions	131
3.8	Models with equality constraints	136
3.9	The revised simplex algorithm	139
3.9.1	Formulating the algorithm	139
3.9.2	The product form of the inverse	141
3.9.3	Applying the revised simplex algorithm	142
3.10	Exercises	144

4	Duality, feasibility, and optimality	151
4.1	The companies Dovetail and Salmonnose	152
4.1.1	Formulating the dual model	152
4.1.2	Economic interpretation	153
4.2	Duality and optimality	154
4.2.1	Dualizing the standard LO-model	154
4.2.2	Dualizing nonstandard LO-models	155
4.2.3	Optimality and optimal dual solutions	159
4.3	Complementary slackness relations	162
4.3.1	Complementary dual variables	162
4.3.2	Complementary slackness	164
4.3.3	Determining the optimality of a given solution	167
4.3.4	Strong complementary slackness	168
4.4	Infeasibility and unboundedness; Farkas' lemma	171
4.5	Primal and dual feasible basic solutions	175
4.6	Duality and the simplex algorithm	179
4.6.1	Dual solution corresponding to the simplex tableau	180
4.6.2	The simplex algorithm from the dual perspective	182
4.7	The dual simplex algorithm	185
4.7.1	Formulating the dual simplex algorithm	187
4.7.2	Reoptimizing an LO-model after adding a new constraint	188
4.8	Exercises	190
5	Sensitivity analysis	195
5.1	Sensitivity of model parameters	195
5.2	Perturbing objective coefficients	197
5.2.1	Perturbing the objective coefficient of a basic variable	197
5.2.2	Perturbing the objective coefficient of a nonbasic variable	202
5.2.3	Determining tolerance intervals from an optimal simplex tableau	203
5.3	Perturbing right hand side values (nondegenerate case)	205
5.3.1	Perturbation of nonbinding constraints	206
5.3.2	Perturbation of technology constraints	207
5.3.3	Perturbation of nonnegativity constraints	213
5.4	Piecewise linearity of perturbation functions	216
5.5	Perturbation of the technology matrix	219
5.6	Sensitivity analysis for the degenerate case	221
5.6.1	Duality between multiple and degenerate optimal solutions	222
5.6.2	Left and right shadow prices	225
5.6.3	Degeneracy, binding constraints, and redundancy	231
5.7	Shadow prices and redundancy of equality constraints	234
5.8	Exercises	237

6	Large-scale linear optimization	247
6.1	The interior path	248
6.1.1	The Karush-Kuhn-Tucker conditions for LO-models	248
6.1.2	The interior path and the logarithmic barrier function	249
6.1.3	Monotonicity and duality	254
6.2	Formulation of the interior path algorithm	255
6.2.1	The interior path as a guiding hand	255
6.2.2	Projections on null space and row space	256
6.2.3	Dikin's affine scaling procedure	258
6.2.4	Determining the search direction	259
6.3	Convergence to the interior path; maintaining feasibility	263
6.3.1	The convergence measure	263
6.3.2	Maintaining feasibility; the interior path algorithm	265
6.4	Termination and initialization	267
6.4.1	Termination and the duality gap	267
6.4.2	Initialization	268
6.5	Exercises	273
7	Integer linear optimization	279
7.1	Introduction	279
7.1.1	The company Dairy Corp	280
7.1.2	ILO-models	281
7.1.3	MILO-models	281
7.1.4	A round-off procedure	282
7.2	The branch-and-bound algorithm	283
7.2.1	The branch-and-bound tree	283
7.2.2	The general form of the branch-and-bound algorithm	286
7.2.3	The knapsack problem	289
7.2.4	A machine scheduling problem	293
7.2.5	The traveling salesman problem; the quick and dirty method	298
7.2.6	The branch-and-bound algorithm as a heuristic	299
7.3	Linearizing logical forms with binary variables	301
7.3.1	The binary variables theorem	301
7.3.2	Introduction to the theory of logical variables	303
7.3.3	Logical forms represented by binary variables	305
7.3.4	A decentralization problem	310
7.4	Gomory's cutting-plane algorithm	312
7.4.1	The cutting-plane algorithm	313
7.4.2	The cutting-plane algorithm for MILO-models	317
7.5	Exercises	319
8	Linear network models	333
8.1	LO-models with integer solutions; total unimodularity	333
8.1.1	Total unimodularity and integer vertices	334

8.1.2	Total unimodularity and ILO-models	336
8.1.3	Total unimodularity and incidence matrices	338
8.2	ILO-models with totally unimodular matrices	345
8.2.1	The transportation problem	345
8.2.2	The balanced transportation problem	347
8.2.3	The assignment problem	349
8.2.4	The minimum cost flow problem	350
8.2.5	The maximum flow problem; the max-flow min-cut theorem	353
8.2.6	Project scheduling; critical paths in networks	361
8.3	The network simplex algorithm	367
8.3.1	The transshipment problem	367
8.3.2	Network basis matrices and feasible tree solutions	369
8.3.3	Node potential vector; reduced costs; test for optimality	372
8.3.4	Determining an improved feasible tree solution	374
8.3.5	The network simplex algorithm	375
8.3.6	Relationship between tree solutions and feasible basic solutions	378
8.3.7	Initialization; the network big-M and two-phase procedures	380
8.3.8	Termination, degeneracy, and cycling	381
8.4	Exercises	385
9	Computational complexity	397
9.1	Introduction to computational complexity	397
9.2	Computational aspects of Dantzig's simplex algorithm	400
9.3	The interior path algorithm has polynomial running time	403
9.4	Computational aspects of the branch-and-bound algorithm	404
9.5	Exercises	407
II	Linear optimization practice: advanced techniques	
10	Designing a reservoir for irrigation	413
10.1	The parameters and the input data	413
10.2	Maximizing the irrigation area	417
10.3	Changing the input parameters of the model	419
10.4	GMPL model code	420
10.5	Exercises	421
11	Classifying documents by language	423
11.1	Machine learning	423
11.2	Classifying documents using separating hyperplanes	425
11.3	LO-model for finding separating hyperplanes	428
11.4	Validation of a classifier	431

II.5	Robustness of separating hyperplanes; separation width	432
II.6	Models that maximize the separation width	434
II.6.1	Minimizing the 1-norm of the weight vector	435
II.6.2	Minimizing the ∞ -norm of the weight vector	435
II.6.3	Comparing the two models	436
II.7	GMPL model code	438
II.8	Exercises	440
12	Production planning: a single product case	441
12.1	Model description	441
12.2	Regular working hours	444
12.3	Overtime	447
12.4	Allowing overtime and idle time	449
12.5	Sensitivity analysis	451
12.6	GMPL model code	454
12.6.1	Model (PP ₂)	454
12.6.2	Model (PP ₃)	454
12.7	Exercises	455
13	Production of coffee machines	459
13.1	Problem setting	459
13.2	An LO-model that minimizes backlogs	460
13.3	Old and recent backlogs	462
13.4	Full week productions	466
13.5	Sensitivity analysis	467
13.5.1	Changing the number of conveyor belts	467
13.5.2	Perturbing backlog-weight coefficients	468
13.5.3	Changing the weights of the 'old' and the 'new' backlogs	469
13.6	GMPL model code	469
13.7	Exercises	471
14	Conflicting objectives: producing versus importing	473
14.1	Problem description and input data	473
14.2	Modeling two conflicting objectives; Pareto optimal points	474
14.3	Goal optimization for conflicting objectives	477
14.4	Soft and hard constraints	481
14.5	Sensitivity analysis	483
14.5.1	Changing the penalties	483
14.5.2	Changing the goals	483
14.6	Alternative solution techniques	484

14.6.1	Lexicographic goal optimization	485
14.6.2	Fuzzy linear optimization	488
14.7	A comparison of the solutions	489
14.8	GMPL model code	490
14.9	Exercises	491
15	Coalition formation and profit distribution	493
15.1	The farmers cooperation problem	493
15.2	Game theory; linear production games	495
15.3	How to distribute the total profit among the farmers?	499
15.4	Profit distribution for arbitrary numbers of farmers	502
15.4.1	The profit distribution	503
15.4.2	Deriving conditions such that a given point is an Owen point	505
15.5	Sensitivity analysis	506
15.6	Exercises	509
16	Minimizing trimloss when cutting cardboard	513
16.1	Formulating the problem	513
16.2	Gilmore-Gomory's solution algorithm	516
16.3	Calculating an optimal solution	519
16.4	Exercises	521
17	Off-shore helicopter routing	523
17.1	Problem description	523
17.2	Vehicle routing problems	524
17.3	Problem formulation	526
17.4	ILO formulation	529
17.5	Column generation	530
17.5.1	Traveling salesman and knapsack problems	533
17.5.2	Generating 'clever' subsets of platforms	534
17.6	Dual values as price indicators for crew exchanges	536
17.7	A round-off procedure for determining an integer solution	538
17.8	Computational experiments	540
17.9	Sensitivity analysis	542
17.10	Exercises	544
18	The catering service problem	547
18.1	Formulation of the problem	547
18.2	The transshipment problem formulation	549

18.3	Applying the network simplex algorithm	552
18.4	Sensitivity analysis	555
18.4.1	Changing the inventory of the napkin supplier	556
18.4.2	Changing the demand	556
18.4.3	Changing the price of napkins and the laundering costs	557
18.5	GMPL model code	558
18.6	Exercises	560

Appendices

A	Mathematical proofs	563
A.1	Direct proof	564
A.2	Proof by contradiction	565
A.3	Mathematical induction	565
B	Linear algebra	567
B.1	Vectors	567
B.2	Matrices	570
B.3	Matrix partitions	571
B.4	Elementary row/column operations; Gaussian elimination	572
B.5	Solving sets of linear equalities	576
B.6	The inverse of a matrix	578
B.7	The determinant of a matrix	579
B.8	Linear and affine spaces	582
C	Graph theory	585
C.1	Undirected graphs	585
C.2	Connectivity and subgraphs	586
C.3	Trees and spanning trees	588
C.4	Eulerian tours, Hamiltonian cycles, and Hamiltonian paths	589
C.5	Matchings and coverings	591
C.6	Directed graphs	592
C.7	Adjacency matrices and incidence matrices	594
C.8	Network optimization models	595
D	Convexity	597
D.1	Sets, continuous functions, Weierstrass' theorem	597
D.2	Convexity, polyhedra, polytopes, and cones	600

D.3	Faces, extreme points, and adjacency	602
D.4	Convex and concave functions	608
E	Nonlinear optimization	611
E.1	Basics	611
E.2	Nonlinear optimization; local and global minimizers	614
E.3	Equality constraints; Lagrange multiplier method	615
E.4	Models with equality and inequality constraints; Karush-Kuhn-Tucker conditions	620
E.5	Karush-Kuhn-Tucker conditions for linear optimization	624
F	Writing LO-models in GNU MathProg (GMPL)	627
F.1	Model Dovetail	627
F.2	Separating model and data	629
F.3	Built-in operators and functions	631
F.4	Generating all subsets of a set	633
	List of Symbols	635
	Bibliography	639
	Author index	645
	Subject index	647
