<i>Preface</i>	ix
<i>Abbreviations and Symbols</i>	xiii

PART 1 THEORY AND PRACTICE

Chapter 1 The Sequence Functions

1.1 Introduction	3
1.2 Orthogonality	4
1.3 The Walsh function series	15
1.4 The Haar function series	38
1.5 Mixed function series	40
1.6 Discrete sampled functions	44
References	45

Chapter 2 Transformation

2.1 Introduction	48
2.2 The discrete Walsh transform	49
2.3 Fast Walsh transform algorithms	58
2.4 The discrete Haar transform	75
2.5 The discrete slant transform	82
2.6 Shift-invariant transformation	86
2.7 Transform conversion	87
2.8 Two-dimensional transformation	93
References	95

Chapter 3 Analysis and Processing

3.1	Introduction	98
3.2	Correlation and convolution	99
3.3	Spectral analysis	103
3.4	Digital filtering	118
3.5	Waveform synthesis	129
	References	133

Chapter 4 Hardware Techniques

4.1	Introduction	137
4.2	Walsh function generators	138
4.3	Transformation	145
4.4	LSI application	158
	References	169

PART 2 APPLICATIONS**Chapter 5 Signal Processing**

5.1	Introduction	175
5.2	Spectroscopy	176
5.3	Speech processing	177
5.4	Medical applications	179
5.5	Seismology	188
5.6	Non-linear applications	194
	References	197

Chapter 6 Image Processing

6.1	Introduction	201
6.2	Image compression	204
6.3	Image enhancement and restoration	214
6.4	Pattern recognition	220
	References	227

Chapter 7 Communications

7.1	Introduction	231
7.2	Multiplexing	232
7.3	Coding	240
7.4	Non-sinusoidal electromagnetic radiation	246
	References	260

Chapter 8 Logical Design and Analysis

8.1	Introduction	264
8.2	Rademacher – Walsh ordering	265
8.3	Synthesis of digital networks	268
8.4	Minimisation of logic functions	271
8.5	Fault diagnosis	281
	References	291
	<i>Selected List of Additional References</i>	295
	<i>Index</i>	301
