

# Quantitative genetics and breeding methods in autopolyploid plants

A. Gallais

# Contents

|   |    |
|---|----|
| <b>Preface</b> .....  | 7  |
| <b>Notations of the main parameters</b> .....                                 | 19 |
| <b>Main particularities of autopolyploids as compared with diploids</b> ..... | 25 |
| <b>CHAPTER 1. Some General aspects of autopolyploid genetics</b> .....        | 29 |
| 1. Types and occurrence of polyploids .....                                   | 29 |
| 2. Meiosis in autopolyploids .....  | 38 |
| 2.1. The phenomenon of double reduction in autotetraploids .....              | 38 |
| 2.2. Double reduction in other autopolyploids .....                           | 42 |
| 2.3. Gametic association of alleles .....                                     | 43 |
| 3. The production of unreduced gametes in diploids .....                      | 44 |
| 4. Segregation for two loci .....   | 46 |
| 4.1. Segregation with bivalent formation .....                                | 46 |
| 4.2. Segregation with multivalent formation .....                             | 48 |
| 5. Mapping in autopolyploids .....  | 51 |

## PART I. POPULATION GENETICS

|  |    |
|--|----|
| <b>CHAPTER 2. Large Random Mating Populations</b> .....  | 59 |
| 1. Genetic constitution of a random mating population .....  | 59 |
| 1.1. Genetic constitution at a single locus .....  | 60 |
| 1.1.1. <i>Gamete frequencies</i> .....   | 60 |
| 1.1.2. <i>Genotype frequencies</i> .....   | 62 |
| 1.2. Genetic constitution of a population for two loci .....   | 66 |
| 1.2.1. <i>The concept of linkage disequilibrium. Definition for diploids ...</i>                     | 66 |
| 1.2.2. <i>Study of linkage disequilibrium in an autopolyploid random mating population</i> .....     | 68 |
| 1.2.3. <i>A generalisation: the concept of "link by descent" in a random mating population</i> ..... | 71 |
| 2. Changes of gene frequency due to mutation and selection .....                                     | 76 |
| 2.1. Mutation and migration .....  | 76 |
| 2.2. Selection pressure .....  | 76 |
| 2.2.1. <i>One-locus selection</i> .....  | 76 |
| 2.2.2. <i>Balance between mutation and selection</i> .....   | 85 |

|  |     |
|--|-----|
| <b>CHAPTER 3. Kinship, inbreeding and small populations</b> .....  | 91  |
| 1. Kinship coefficients and coefficients of inbreeding .....   | 92  |
| 1.1. The concept of identity by descent .....  | 92  |
| 1.2. Kinships between non-inbred relatives .....   | 93  |
| 1.2.1. <i>Kinship coefficients for autotetraploids</i> .....   | 93  |
| 1.2.2. <i>Kinship coefficients for a 2v-ploidy level</i> .....   | 95  |
| 1.2.3. <i>Kinship coefficients in presence of gametic disequilibrium</i> .....   | 99  |
| 1.3. Kinship between inbred relatives .....  | 100 |
| 1.4. Coefficients of inbreeding .....  | 101 |
| 1.5. Relationships between kinship and inbreeding .....  | 103 |
| 2. Inbreeding in large populations .....   | 106 |
| 2.1. Genotype frequencies in an inbred population .....  | 106 |
| 2.1.1. <i>Genotype frequencies in terms of coefficients of inbreeding</i> .....  | 106 |
| 2.1.2. <i>Genotype distribution in terms of coefficients of identity in state</i> .....  | 107 |
| 2.2. Gamete and genotype frequencies with double reduction .....   | 109 |
| 2.2.1. <i>Gamete frequencies</i> .....   | 109 |
| 2.2.2. <i>Genotype frequencies in an arbitrary generation</i> .....  | 111 |
| 2.3. Random mating after inbreeding .....  | 115 |
| 2.4. Change in the coefficients of identity by descent with regular<br>self-fertilization .....                                      | 116 |
| 2.4.1. <i>Study from the generation matrix with chromosome segregation</i> .....   | 116 |
| 2.4.2. <i>The effect of double reduction</i> .....   | 119 |
| 2.4.3. <i>Direct study of the coefficient of inbreeding of order 1 (F)</i> .....   | 121 |
| 2.4.4. <i>Genome structure and junctions under inbreeding in autotetraploids</i> .....   | 123 |
| 2.5. Inbreeding of a population with a rate <i>S</i> of self-fertilization .....   | 125 |
| 3. Finite and structured populations .....   | 128 |
| 3.1. Finite populations – the effects of genetic drift .....   | 128 |
| 3.1.1. <i>Change of mean and variance in gene frequencies due<br/>                to genetic drift</i> .....                         | 128 |
| 3.1.2. <i>Inbreeding coefficient in a population of restricted size</i> .....  | 129 |
| 3.2. Subdivided populations .....  | 132 |
| 3.2.1. <i>The Wahlund effect</i> .....   | 133 |
| 3.2.2. <i>Wright's F-Statistics and their extension to autopolyploids</i> .....  | 135 |
| 3.2.3. <i>Equilibrium values of the Wright's F-coefficients in an island<br/>                model of population structure</i> ..... | 145 |
| 3.2.4. <i>Estimation Wright's F-Statistics by ANOVA</i> .....  | 148 |
| 4. Natural selection in inbreeding populations .....   | 150 |
| 4.1. Balance between mutation and selection in partially self-fertilizing<br>populations .....                                       | 150 |
| 4.2. Inbreeding depression as a function of the selfing rate in autotetraploid<br>populations .....                                  | 151 |

## PART II. QUANTITATIVE GENETICS

**CHAPTER 4. Genetic effects and quantitative genetics in random mating populations** .....

|   |     |
|---|-----|
| <b>CHAPTER 4. Genetic effects and quantitative genetics in random mating populations</b> .....  | 157 |
| 1. Genetic effects in random mating populations .....   | 158 |
| 1.1. Definition of genotypic values and broad-sense heritability .....  | 158 |
| 1.1.1. <i>Definition within a macro-environment</i> .....   | 158 |
| 1.2.2. <i>Genotypic values and broad-sense heritability with several macro-environments</i> .....   | 162 |
| 1.2. Model for genotypic value with multiallelism .....   | 163 |
| 1.2.1. <i>Definition of genetic effects</i> .....   | 163 |
| 1.2.2. <i>Genetic effects and combining ability</i> .....   | 166 |
| 1.3. Genetic effects with biallelism .....  | 168 |
| 1.3.1. <i>Tetragenic interaction model (<math>M_4</math> model)</i> .....   | 168 |
| 1.3.2. <i>Trigenic interaction model (<math>M_3</math> or trigenic model)</i> .....   | 172 |
| 1.3.3. <i>Digenic interaction model (<math>M_2</math> or digenic model)</i> .....   | 174 |
| 1.3.4. <i>Additive model</i> .....  | 176 |
| 1.3.5. <i>Another writing of the models</i> .....   | 176 |
| 1.3.6. <i>A unified notation for biallelism</i> .....   | 178 |
| 1.3.7. <i>A biochemical basis of dominance</i> .....  | 179 |
| 1.4. Extension of the model to several loci .....   | 180 |
| 1.4.1. <i>The model at several loci in the absence of epistasis</i> .....   | 180 |
| 1.4.2. <i>Genetic effects in the presence of epistasis</i> .....  | 181 |
| 1.4.3. <i>An approximate estimate of additive variance</i> .....  | 183 |
| 1.4.4. <i>Definition and meaning of narrow-sense heritability</i> .....   | 184 |
| 1.5. Comparison of genetic effects between diploids and autotetraploids .....   | 185 |
| 1.5.1. <i>One-locus autotetraploids and one-locus diploids</i> .....  | 185 |
| 1.5.2. <i>Two-locus diploids and one-locus autotetraploids</i> .....  | 186 |
| 1.6. Genetic effects and variance components in presence of GE interactions   | 190 |
| 1.7. Phenotypic and genetic correlations among traits .....   | 191 |
| 2. Covariance between relatives in panmictic populations .....  | 193 |
| 2.1. General formulation .....  | 193 |
| 2.1.1. <i>Expression of covariance for autotetraploids</i> .....  | 193 |
| 2.1.2. <i>Expression of covariances for 2v-ploids</i> .....   | 196 |
| 2.2. Relationships between kinship coefficients, genotypic or phenotypic correlations among relatives and narrow-sense heritability ..... | 197 |
| 2.3. Comparison between one-locus autotetraploids and two-locus diploids .  | 198 |
| 3. Means and variances for non-equilibrium populations .....  | 200 |
| 3.1. Means and variances with panmictic disequilibrium .....  | 200 |
| 3.1.1. <i>Population mean with panmictic disequilibrium</i> .....   | 200 |
| 3.1.2. <i>Covariances between relatives with panmictic disequilibrium</i> ...   | 201 |
| 3.2. Means and variances with linkage disequilibrium .....  | 203 |
| 3.2.1. <i>Population mean with linkage disequilibrium</i> .....   | 203 |
| 3.2.2. <i>Covariances between relatives with linkage disequilibrium</i> .....   | 204 |
| 4. Mating designs to estimate variance components of random mating populations  | 208 |
| 4.1. General considerations .....   | 208 |

|   |     |
|---|-----|
| 4.2. One-way mating designs .....   | 210 |
| 4.3. Two-way mating designs .....   | 210 |
| 4.3.1. <i>Principles of analysis</i> .....  | 210 |
| 4.3.2. <i>North Carolina design I or nested design</i> .....  | 211 |
| 4.3.3. <i>North Carolina design II or factorial design</i> .....  | 212 |
| 4.3.4. <i>Diallel mating design</i> .....   | 214 |
| 4.3.5. <i>Adding the cloned parents to the two-factor mating designs</i> .....                          | 215 |
| 4.4. Three and four-way mating designs .....  | 216 |
| 4.4.1. <i>Example of a three-way mating designs: the mating design</i><br><i>A (B×C)</i> .....          | 216 |
| 4.4.2. <i>Example of a four-way mating design: the mating design</i><br><i>(B/A)(D/C)</i> .....         | 217 |
| 4.5. Some elements to determine the accuracy of variance components<br>estimates .....                  | 218 |
| 5. QTL detection in autotetraploids .....   | 220 |
| 5.1. Principles of QTL detection .....  | 220 |
| 5.2. Marker-genotype means for different segregating populations .....                                  | 221 |
| 5.2.1. <i>Recombinant Inbred Lines (RIL) or Quadrupled-Haploid Lines</i><br><i>(QHL)</i> .....          | 221 |
| 5.2.2. <i>Backcross populations</i> .....   | 222 |
| 5.2.3. <i>F<sub>2</sub> Populations</i> .....   | 223 |
| 5.2.4. <i>F<sub>1</sub> from the cross between two heterozygous plants</i> .....                        | 224 |
| 5.3. Studies with markers one by one .....  | 226 |
| 5.3.1. <i>Analysis of variance</i> .....  | 227 |
| 5.3.2. <i>Test of epistasis and QTL × environment interactions</i> .....                                | 228 |
| 5.3.3. <i>Factors influencing QTL detection</i> .....   | 229 |
| 5.4. Maximum likelihood estimation and interval mapping .....   | 232 |
| 5.4.1. <i>Principle of the maximum likelihood estimation</i> .....                                      | 232 |
| 5.4.2. <i>Maximum likelihood interval mapping</i> .....   | 234 |
| 5.5. A regression approach of interval mapping .....  | 236 |
| 5.6. Composite interval mapping .....   | 238 |
| 5.7. A practical approach of QTL detection .....  | 239 |
| <b>CHAPTER 5. Quantitative genetics of inbred populations</b> .....                                     | 241 |
| 1. Means of inbred populations .....  | 241 |
| 1.1. General formulation of means .....   | 242 |
| 1.1.1. <i>Inbred population deriving from a random mating population</i><br><i>in equilibrium</i> ..... | 242 |
| 1.1.2. <i>Inbred population deriving from a population in panmictic</i><br><i>disequilibrium</i> .....  | 243 |
| 1.2. Comparison of autotetraploids with isogenic allotetraploids .....                                  | 244 |
| 1.3. Expected value of zygotic states of identity by descent in autotetraploids                         | 244 |
| 1.4. Application to the study of inbreeding depression in self-fertilization ...                        | 247 |
| 1.4.1. <i>Change in the contribution of some parameters</i> .....                                       | 247 |
| 1.4.2. <i>Principal components of the mean under self-fertilization</i> .....                           | 248 |

|  |     |
|--|-----|
| 1.5. Experimental results .....  | 249 |
| 1.5.1. <i>Inbreeding effects under self-fertilization</i> .....  | 249 |
| 1.5.2. <i>Estimation of the value of the zygotic states of identity by descent</i> .....   | 251 |
| 1.6. Mean of an induced tetraploid population .....  | 252 |
| 1.6.1. <i>General formulation of the population mean</i> .....   | 252 |
| 1.6.2. <i>Origin of the doubling depression</i> .....  | 253 |
| 1.6.3. <i>Comparison of inbreeding depression in autotetraploids<br/>            and isogenic allotetraploids</i> .....                  | 255 |
| 2. Covariances among inbred relatives .....  | 257 |
| 2.1. General formulation of the covariance .....   | 257 |
| 2.1.1. <i>Covariances between inbred relatives with multiallelism<br/>                and no restriction on genic interactions</i> ..... | 257 |
| 2.1.2. <i>Covariances between inbred relatives with biallelism<br/>                and only digenic interactions</i> .....               | 259 |
| 2.1.3. <i>Effect of double reduction on covariances between relatives<br/>                in a random mating population</i> .....        | 262 |
| 2.1.4. <i>Effect of panmictic and linkage disequilibria</i> .....  | 263 |
| 2.2. The change in variance under self-fertilization .....   | 264 |
| 2.2.1. <i>Change in the total genotypic variance</i> .....   | 264 |
| 2.2.2. <i>The redistribution of variance under self-fertilization</i> .....  | 265 |
| 2.3. Estimation of variance components .....   | 268 |
| 2.4. Experimental results in lucerne .....   | 269 |
| 2.5. Reducing the number of parameters .....   | 271 |
| 2.6. Particular cases of inbreeding .....  | 273 |
| 2.6.1. <i>The effect of chromosome doubling</i> .....  | 273 |
| 2.6.2. <i>Effect of FDR and SDR meiosis</i> .....  | 276 |
| 2.6.3. <i>Triploid endosperm</i> .....   | 278 |
| 3. Effect of random mating after inbreeding .....  | 280 |
| 3.1. General formulation of the population mean .....  | 280 |
| 3.2. Hybridisation after inbreeding .....  | 282 |
| 3.2.1. <i>Crossing after inbreeding from a random mating population</i> .....  | 282 |
| 3.2.2. <i>Effects of the panmictic and linkage disequilibria</i> .....   | 288 |
| 3.3. Comparison of autotetraploids and isogenic allotetraploids .....  | 290 |
| 4. Heterosis between two populations .....   | 291 |

### PART III. POPULATION IMPROVEMENT AND VARIETAL DEVELOPMENT

|   |     |
|---|-----|
| <b>CHAPTER 6. Population improvement</b> .....  | 297 |
| 1. Principles and theory of recurrent selection .....   | 297 |
| 1.1. A general strategy of varietal development .....   | 297 |
| 1.2. Structure of a cycle of recurrent selection and classification<br>of recurrent selection schemes. .... | 300 |
| 1.3. Concepts of test and varietal value .....  | 301 |
| 1.3.1. <i>Definitions</i> .....   | 301 |
| 1.3.2. <i>Line value</i> .....  | 303 |
| 1.3.3. <i>S<sub>J</sub>, S<sub>n</sub> and doubled-haploid values</i> .....                                 | 305 |

|  |     |
|--|-----|
| 1.3.4. <i>Hybrid values</i> .....  | 309 |
| 1.3.5. <i>Synthesizing value (value in synthetics)</i> .....   | 311 |
| 1.3.6. <i>Testcross value</i> .....  | 314 |
| 1.4. A general formulation of the response to recurrent selection .....  | 316 |
| 1.4.1. <i>Response after one cycle of selection</i> .....  | 316 |
| 1.4.2. <i>Effect of relaxation of selection and response after n cycles<br/>          of recurrent selection</i> ..... | 320 |
| 1.4.3. <i>Effect of the inbreeding of the parents</i> .....  | 322 |
| 1.4.4. <i>Change in gene and gamete frequency due to selection</i> .....   | 325 |
| 1.4.5. <i>Parameters of the genetic advance: a synthesis</i> .....   | 326 |
| 1.5. Indirect selection and selection index .....  | 329 |
| 1.6. Recurrent selection in the presence of GE interactions .....  | 333 |
| 1.6.1. <i>Selection in only one environment</i> .....  | 334 |
| 1.6.2. <i>Selection for a general adaptation</i> .....   | 335 |
| 2. Within population recurrent selection schemes .....   | 336 |
| 2.1. Phenotypic selection .....  | 337 |
| 2.1.1. <i>Individual selection (mass selection)</i> .....  | 337 |
| 2.1.2. <i>Family selection</i> .....   | 340 |
| 2.1.3. <i>Combined selection</i> .....   | 351 |
| 2.2. Selection with progeny testing .....  | 356 |
| 2.2.1. <i>Selection on GCA (half-sib progeny test)</i> .....   | 356 |
| 2.2.2. <i>Selection on full-sib progenies (FSP)</i> .....  | 359 |
| 2.2.3. <i>Selection on <math>S_1</math> progeny</i> .....  | 360 |
| 2.2.4. <i>Recurrent selection with a tester (testcross progenies)</i> .....  | 363 |
| 2.2.5. <i>Family and combined selection with progeny test</i> .....  | 368 |
| 2.3. Comparison of the intra-population recurrent selection methods .....  | 369 |
| 2.3.1. <i>General considerations for the comparison</i> .....  | 369 |
| 2.3.2. <i>Comparison for a low heritability trait</i> .....  | 372 |
| 2.3.3. <i>Comparison for a high heritability trait</i> .....   | 374 |
| 2.3.4. <i>Comparison for additivity only</i> .....   | 375 |
| 2.3.5. <i>A more general comparison</i> .....  | 377 |
| 2.3.6. <i>Conclusion</i> .....   | 379 |
| 2.4. Particular cases .....  | 382 |
| 2.4.1. <i>Consequences of first and second division restitution</i> .....  | 382 |
| 2.4.2. <i>Induced autotetraploids</i> .....  | 383 |
| 3. Inter-population recurrent selection .....  | 387 |
| 3.1. Reciprocal recurrent selection .....  | 388 |
| 3.1.1. <i>RRS with half-sib families</i> .....   | 388 |
| 3.1.2. <i>RRS with full-sib families (FS-RRS)</i> .....  | 391 |
| 3.1.3. <i>Reciprocal recurrent selection between a diploid<br/>              and a tetraploid population</i> .....     | 394 |
| 3.2. Inter-population recurrent selection with more than two populations .....   | 395 |
| 3.2.1. <i>Four populations bred simultaneously</i> .....   | 395 |
| 3.2.2. <i>Three or four-way recurrent selection with tester(s)</i> .....   | 400 |
| 4. Marker-assisted recurrent selection .....   | 402 |

|   |            |
|---|------------|
| 4.1. General considerations .....   | 402        |
| 4.2. Selection on markers only (MSO) .....  | 403        |
| 4.3. Recurrent selection on the molecular score (MSS) .....   | 404        |
| 4.4. Combined marker assisted recurrent selection (C-MARS) .....  | 407        |
| 4.5. Conclusions .....  | 411        |
| 5. Some aspects of optimization of recurrent selection .....  | 412        |
| 5.1. Number of plants per plot in family or progeny testing .....   | 412        |
| 5.2. Number of replications and selection intensity in progeny testing .....  | 412        |
| 5.3. Optimization of the selection in the presence of GE interactions .....   | 413        |
| 5.4. Optimization of selection in several stages .....  | 414        |
| <b>CHAPTER 7. Varietal Development</b> .....  | <b>415</b> |
| 1. Development of clone varieties .....   | 415        |
| 1.1. Improvement of clonal value through phenotypic clonal recurrent<br>selection .....                                       | 415        |
| 1.2. Improvement of clonal value through reciprocal full-sib recurrent<br>selection .....                                     | 418        |
| 1.3. Maximizing heterozygosity and clonal value by QH and protoplast fusion   | 418        |
| 2. Line development .....   | 419        |
| 2.1. Justification of line development .....  | 419        |
| 2.2. Development of inbreeding .....  | 420        |
| 2.3. Prediction of line value .....   | 421        |
| 2.4. Recurrent selection for line value .....   | 422        |
| 3. Hybrid development .....   | 424        |
| 3.1. Justification .....  | 424        |
| 3.2. Optimal type of hybrids .....  | 425        |
| 3.2.1. <i>Mean of the crosses according to inbreeding of the parents</i> .....  | 427        |
| 3.2.2. <i>Variance among crosses</i> .....  | 428        |
| 3.2.3. <i>Consequences: optimal inbreeding level and optimal type of hybrid</i>   | 430        |
| 3.3. Prediction of three and four-way crosses .....   | 434        |
| 3.4. Evaluation of combining ability .....  | 435        |
| 3.4.1. <i>Effect of the genetic structure of the tester</i> .....   | 435        |
| 3.4.2. <i>Effect of inbreeding level of the tested plant</i> .....  | 436        |
| 3.4.3. <i>Prediction of the combining ability of lines that can be derived<br/>      from an <math>S_0</math> plant</i> ..... | 437        |
| 3.4.4. <i>Predicting combining ability of a line in double-cross and three-<br/>      way cross combinations</i> .....        | 438        |
| 3.5. Pedigree selection and development of hybrids .....  | 438        |
| 3.5.1. <i>Pedigree selection for combining ability</i> .....  | 438        |
| 3.5.2. <i>Development of lines before testing combining abilities</i> .....   | 440        |
| 3.5.3. <i>Development of hybrids from <math>S_0</math> plants</i> .....   | 440        |
| 3.6. Usefulness of inbreeding .....   | 442        |
| 4. Development of synthetics .....  | 443        |
| 4.1. Definition and justification of synthetics .....   | 443        |
| 4.2. Vigour of synthetics in advanced generations .....   | 445        |

|   |     |
|---|-----|
| 4.2.1. <i>Mean of advanced generations with random mating</i> .....   | 445 |
| 4.2.2. <i>Mean in advanced generations with autosterility</i> .....   | 446 |
| 4.2.3. <i>Mean with a rate S of self-fertilization in each generation</i> .....   | 450 |
| 4.2.4. <i>Another approach to the change in means</i> .....   | 451 |
| 4.3. <i>Predicting the value of a synthetic</i> .....   | 451 |
| 4.3.1. <i>Necessity for the prediction</i> .....  | 451 |
| 4.3.2. <i>A statistical approach to the prediction of the value of a synthetic</i> .....                                      | 452 |
| 4.3.3. <i>Genetic approach to the prediction of the value of synthetics</i> ....  | 453 |
| 4.3.4. <i>Prediction of the General Synthesizing Ability</i> .....  | 456 |
| 4.3.5. <i>Experimental results</i> .....  | 457 |
| 4.4. <i>Variance among synthetics</i> .....   | 458 |
| 4.4.1. <i>First approach from predictors</i> .....  | 458 |
| 4.4.2. <i>A general expression of the variance among synthetics</i> .....   | 459 |
| 4.4.3. <i>Relationships between variances of synthesizing abilities<br/>            and variance of genetic effects</i> ..... | 460 |
| 4.4.4. <i>Effect of the inbreeding of the parents</i> .....   | 461 |
| 4.4.5. <i>Conclusion</i> .....  | 462 |
| 4.5. <i>Optimal base of synthetics</i> .....  | 462 |
| 4.6. <i>Breeding for development of synthetics</i> .....  | 465 |
| 5. <i>Choice of type of varieties</i> .....   | 466 |
| 5.1. <i>General formulation</i> .....   | 466 |
| 5.1.1. <i>Expressions of means</i> .....  | 467 |
| 5.1.2. <i>Expressions of variances</i> .....  | 468 |
| 5.2. <i>Prediction of means and variances among varieties</i> .....   | 470 |
| 5.2.1. <i>Prediction of means</i> .....   | 470 |
| 5.2.2. <i>Prediction of variance among varieties</i> .....  | 470 |
| 5.3. <i>Choice of type of variety</i> .....   | 471 |
| 5.3.1. <i>General considerations</i> .....  | 471 |
| 5.3.2. <i>Lines versus clones</i> .....   | 472 |
| 5.3.3. <i>Single and double crosses vs. lines</i> .....   | 473 |
| 5.3.4. <i>Hybrids versus populations</i> .....  | 474 |
| 5.3.5. <i>Hybrids, population, clones or synthetics</i> .....   | 475 |
| 5.4. <i>Effect of long-term recurrent selection</i> .....   | 477 |
| <b>By way of conclusion</b>   |     |
| On the usefulness of models in quantitative genetics and plant breeding .....   | 481 |
| <b>Appendices</b>   |     |
| Critical values of F distribution .....   | 483 |
| Critical value of Pearson correlation coefficient .....   | 486 |
| Relationship between selection intensity (i) and percentage of selected units (p. %)  | 487 |
