Preamble	xv
Preface	xvii
The idea of homology	xvii
The idea of discrete Morse theory	xix
A sample application	xx
How to use this book	xxii
Prerequisites	xxiii
Guide to the literature	xxiii
Part 1. Introduction to Homology	
Chapter 1. The First Steps	3
§1.1. Dimension 0: Counting points using vector spaces and free abelian groups	3
§1.2. Dimension 1: Graphs	4
§1.3. Dimension 2: Losing the freedom	10
Exercises	13
Chapter 2. Simplicial Homology	15
§2.1. Plain simplicial complexes	15
§2.2. The boundary operator	19
§2.3. Homology of a plain simplicial complex	23
§2.4. Geometric realization	30

§2.5. Finite abstract simplicial complexes and standard constructions	33
§2.6. Abstract simplicial complexes on finite ordered sets	36
§2.7. Further constructions and associated homology	40
§2.8. Simplicial maps	51
Exercises	52
Chapter 3. Beyond the Simplicial Setting	57
§3.1. Polyhedral homology	57
§3.2. Chain complexes of free abelian groups	59
§3.3. Cell complexes	62
§3.4. Infinite abstract simplicial complexes	66
§3.5. Semisimplicial sets	67
§3.6. Arbitrary finitely generated abelian groups as homology groups	75
Exercises	77
Part 2. Further Aspects of Homology Theory	
Chapter 4. Category of Chain Complexes	81
§4.1. Chain complexes of modules over a ring	81
§4.2. Constructions with chain complexes	83
§4.3. Cones and cylinders based at chain complexes	85
§4.4. Chain maps	87
Exercises	91
Chapter 5. Chain Homotopy	93
§5.1. Chain homotopy	93
§5.2. Some applications of chain homotopy	97
§5.3. Alternative definition of chain homotopy via chain maps of cylinders	99
Exercises	101
Chapter 6. Connecting Homomorphism	103
§6.1. Homology map induced by inclusion	103
§6.2. Relative homology	106
§6.3. Connecting homomorphism	109
§6.4. Maps between pairs and connecting homomorphism	112
§6.5. Zig-Zag Lemma	114

Exercises	117
Chapter 7. Singular Homology	119
§7.1. Definition of singular homology	119
§7.2. Singular homology as a functor	121
§7.3. Simplicial approximation	122
§7.4. The 5-Lemma	125
§7.5. Independence of simplicial homology of the triangulation	126
Exercises	128
Chapter 8. Cellular Homology	131
§8.1. Winding number	131
§8.2. Incidence numbers	134
§8.3. Cellular chain complex	135
§8.4. Alternative definition of the cellular boundary operator	136
§8.5. Equivalence of singular and cellular homology	137
Exercises	139
Suggested further reading for Parts 1 and 2	141
Part 3. Basic Discrete Morse Theory	
Chapter 9. Simplicial Collapses	147
§9.1. Collapses in abstract simplicial complexes	147
§9.2. Collapses and topology	150
§9.3. More on collapses	153
§9.4. Collapses and chain homotopy	159
§9.5. A glimpse of simple homotopy theory	160
Exercises	163
Chapter 10. Organizing Collapsing Sequences	165
§10.1. Face poset of an abstract simplicial complex	165
§10.2. Acyclic matchings	169
§10.3. Collapsing sequences vs acyclic matchings: Theorem A	172
§10.4. Collapsing sequences and cones	174
§10.5. Standard subdivisions of collapsible complexes	176
§10.6. Standard chromatic subdivision	180
§10.7. Combinatorial collapsing sequences	184

Exercises	190
Chapter 11. Internal Collapses and Discrete Morse Theory	193
§11.1. Replacing the simplicial complex with a smaller cellular complex: Theorem B	193
§11.2. Internal collapses and attachment maps	195
§11.3. Attaching cells to homotopy equivalent spaces	197
§11.4. Organizing internal collapses	199
§11.5. Examples of computation	203
§11.6. An acyclic matching associated to a sequence of vertices	208
Exercises	209
Chapter 12. Explicit Homology Classes Associated to Critical Cells	211
§12.1. The graph $G_d(\mu)$ and its use	211
§12.2. The closure map φ	214
§12.3. Homology generators associated to critical cells in an isolated dimension	218
§12.4. Sample applications	221
Exercises	223
Chapter 13. The Critical Morse Complex	225
§13.1. A basis for the chain groups associated to the acyclic matching	225
§13.2. Decomposition of the chain complex	227
§13.3. The language of alternating paths	228
§13.4. Morse complex for \mathbb{Z}_2 -coefficients	229
§13.5. Morse complex for \mathbb{Z} -coefficients and Theorem C	230
Exercises	231
Chapter 14. Implications and Variations	233
§14.1. Relaxing the simplicial structure	233
§14.2. Discrete Morse functions and gradient vector fields	239
§14.3. Subsuming shellability	240
§14.4. Infinite simplicial complexes	243
Exercises	243
Suggested further reading for Part 3	245

Part 4. Extensions of Discrete Morse Theory

Chapter 15. Algebraic Morse Theory	249
§15.1. Replacing simplicial complexes with general chain complexes	249
§15.2. Eliminating the matched part	252
§15.3. Algebraic Morse complex	260
§15.4. An example	263
§15.5. Algebraic Morse theory for based free chain complexes of \mathcal{R} -modules	265
Exercises	269
Chapter 16. Discrete Morse Theory for Posets	271
§16.1. Poset maps with small fibers	271
§16.2. Collapsing orders and the universal object associated to an acyclic matching	273
§16.3. Poset fibrations and the Patchwork Theorem	276
Exercises	280
Chapter 17. Discrete Morse Theory for CW Complexes	281
§17.1. Cellular collapses and topological consequences	281
§17.2. Acyclic matchings yielding a wedge of spheres	283
§17.3. An example using Hopf fiber bundles	285
Exercises	286
Chapter 18. Discrete Morse Theory and Persistence	287
§18.1. Persistent homology of filtered simplicial complexes	287
§18.2. Combining persistence with discrete Morse theory	290
Exercises	293
Suggested further reading for Part 4	295
Index	297
List of Figures	301
List of Tables	305
Bibliography	307
