

Contents

Introduction	1
Chapter 1. Basic Definitions and Results	7
1.1. Bernoulli shift actions	7
1.2. Hyper-aperiodic elements	9
1.3. Toast, an application of hyper-aperiodicity	11
1.4. A hyper-aperiodic element with partial periodicity	13
1.5. The continuous chromatic number of $F(2^{\mathbb{Z}^2})$	14
1.6. CBS line sections and single line sections	17
1.7. Continuous cocycles	20
1.8. Marker distortion	23
Chapter 2. The Twelve Tiles Theorem	29
2.1. From proper colorings to subshifts of finite type	30
2.2. The two tiles theorem in one dimension	33
2.3. Statement of the twelve tiles theorem	35
2.4. Proof of the negative direction	43
2.5. Proof of the positive direction	48
2.6. Continuous structurings	55
2.7. Higher dimensions	60
Chapter 3. Applications of the Twelve Tiles Theorem	63
3.1. Basic applications of the Twelve Tiles Theorem	63
3.2. Continuous subactions and regular tilings	69
3.3. Undirected graph homomorphisms and the reduced homotopy group	75
3.4. Negative conditions for graph homomorphisms	79
3.5. A positive condition for graph homomorphisms	84
Chapter 4. Applications to Decidability Problems	93
4.1. Three general problems	93
4.2. The subshift problem for $F(2^{\mathbb{Z}})$	94
4.3. The subshift problem for $F(2^{\mathbb{Z}^2})$	96
4.4. The graph homomorphism problem	107
4.5. The tiling problem	115
