Preface

I Numerical linear algebra

1 A summary of results on matrices	1
Introduction	1
1.1 Key definitions and notation	2
1.2 Reduction of matrices	10
1.3 Special properties of symmetric and Hermitian matrices	15
1.4 Vector and matrix norms	20
1.5 Sequences of vectors and matrices	32
2 General results in the numerical analysis of matrices	37
Introduction	37
2.1 The two fundamental problems; general observations on the methods in use	37
2.2 Condition of a linear system	45
2.3 Condition of the eigenvalue problem	58
3 Sources of problems in the numerical analysis of matrices	64
Introduction	64
3.1 The finite-difference method for a one-dimensional boundary-value problem	65
3.2 The finite-difference method for a two-dimensional boundary-value problem	79
3.3 The finite-difference method for time-dependent boundary-value problems	86
3.4 Variational approximation of a one-dimensional boundary-value problem	94
3.5 Variational approximation of a two-dimensional boundary-value problem	106
3.6 Eigenvalue problems	110
3.7 Interpolation and approximation problems	115
4 Direct methods for the solution of linear systems	124
Introduction	124
4.1 Two remarks concerning the solution of linear systems	125

4.2	Gaussian elimination	127
4.3	The LU factorisation of a matrix	138
4.4	The Cholesky factorisation and method	147
4.5	The QR factorisation of a matrix and Householder's method	152
5	Iterative methods for the solution of linear systems	159
	Introduction	159
5.1	General results on iterative methods	159
5.2	Description of the methods of Jacobi, Gauss–Seidel and relaxation	163
5.3	Convergence of the Jacobi, Gauss–Seidel and relaxation methods	171
6	Methods for the calculation of eigenvalues and eigenvectors	186
	Introduction	186
6.1	The Jacobi method	187
6.2	The Givens–Householder method	196
6.3	The QR algorithm	204
6.4	Calculation of eigenvectors	212
II	Optimisation	
7	A review of differential calculus. Some applications	216
	Introduction	216
7.1	First and second derivatives of a function	218
7.2	Extrema of real functions: Lagrange multipliers	232
7.3	Extrema of real functions: consideration of the second derivatives	240
7.4	Extrema of real functions: consideration of convexity	241
7.5	Newton's method	251
8	General results on optimisation. Some algorithms	266
	Introduction	266
8.1	The projection theorem; some consequences	268
8.2	General results on optimisation problems	277
8.3	Examples of optimisation problems	286
8.4	Relaxation and gradient methods for unconstrained problems	291
8.5	Conjugate gradient methods for unconstrained problems	311
8.6	Relaxation, gradient and penalty-function methods for constrained problems	321
9	Introduction to non-linear programming	330
	Introduction	330
9.1	The Farkas lemma	332
9.2	The Kuhn–Tucker conditions	336
9.3	Lagrangians and saddle points. Introduction to duality	350
9.4	Uzawa's method	360
10	Linear programming	369
	Introduction	369
10.1	General results on linear programming	370

10.2 Examples of linear programming problems	374
10.3 The simplex method	378
10.4 Duality and linear programming	400
<i>Bibliography and comments</i>	411
<i>Main notations used</i>	422
<i>Index</i>	428
