I. Bayesian regression and prior distributions	1
1. Introduction	1
2. Estimation and design as a Bayesian decision problem	7
2.1. Specification of the decision problem	7
2.2. The classical and the Bayesian approach	10
3. Choice of a prior distribution	13
3.1. Some ad-hoc proposals	14
3.2. Integral geometric prior distributions	20
4. Conjugate prior distributions	23
4.1. Definition of a conjugate prior	24
4.2. Properties of conjugate priors	26
4.3. Conjugate prior and posterior distributions for normal errors	29
4.4. Some remarks on the specification of a normal-gamma – prior	33
II. Bayesian estimation	38
5. Bayes estimation of the regression parameter	38
5.1. Bayes estimation with quadratic loss	38
5.2. The conjugate Bayes estimator	43
5.3. Bayes linear estimation	47
5.4. Risk improvement over the LSE	51
5.5. Stein-type modifications of the conjugate Bayes estimator	58
5.6. Hierarchical Bayes estimation	60
6. Optimality and robustness of the linear Bayes estimator	63
6.1. Robustness of Bayes optimality	63
6.2. Bayesian robustness measures	69
6.3. Restricted minimax optimality	76
7. Characterization of Bayes and admissible linear estimators	85
7.1. General remarks	85
7.2. Admissible linear estimation with unconstrained θ	87

7.3. Bayesian interpretation of estimators using non-Bayesian prior knowledge	94
7.3.1. Linear restrictions	95
7.3.2. Use of prior estimates	97
7.3.3. Minimax linear, ridge and shrunken estimators	99
8. Bayes estimation in case of prior ignorance	103
9. Further problems	108
9.1. Empirical Bayes estimation	108
9.2. Bayes estimation in inadequate models	113
9.3. Further literature	116
III. Bayesian experimental design	118
10. The design problem for the linear Bayes estimator	118
10.1. The exact design problem	119
10.2. The Bayesian information matrix	120
10.3. The extended design problem	122
11. Characterization of optimal designs	127
11.1. Properties of the design functionals	128
11.2. Admissibility and complete classes of designs	133
11.3. Equivalence theorems	136
12. Construction of optimal continuous designs	142
12.1. Construction of A_B -optimal designs	143
12.2. L_B -optimal and Bayesian designs	152
12.3. D_B - and E_B -optimality of designs	157
12.4. Optimal designs for multiple linear regression	162
12.5. Iteration procedures for the construction of approximately optimal designs	174
13. Construction of exact optimal designs	183
13.1. Rounding of discrete optimal designs	183
13.2. Exact optimal designs for multiple linear regression	187
13.3. Iteration procedures	196
14. Further problems	201
14.1. Bayesian one-point designs	201
14.2. Cost-optimal designs	205
14.3. Further literature and research	206
IV. Minimax and admissible linear regression estimation with restricted parameter regions	209
15. Minimax linear and affine estimation in true models	211
15.1. Minimax linear estimators	211
15.1.1. Characterization of minimax linear estimators	211
15.1.2. Analogies with Bayesian experimental design	216
15.1.3. Maximin linear estimators	220
15.1.4. Projection of minimax estimators	222
15.2. Minimax affine estimators	223
15.3. Minimax estimation with ellipsoid constraints	231

15.4. Minimax estimation with linear inequality constraints	244
15.5. Generalization to restricted minimax estimation	248
16. Admissible linear estimation under parameter restrictions	249
16.1. Characterization of admissible linear estimators	250
16.2. Universal improvements over the LSE	256
17. The minimax approach to fitting biased response surfaces	258
17.1. The minimax approssion problem	259
17.2. Computation of the least favourable prior	261
17.3. The special case of nested models	263
Appendix	267
