1	Introduction	1
1.1	Aim of this work and basic assumptions	2
1.2	Closely related work on corrugation models	4
2	The problem of corrugation in literature	10
2.1	Phenomenological approaches	11
2.2	Experimental work and field trials	11
2.3	Theoretical work	14
2.4	Conclusion on experimental and theoretical work	15
2.4.1	General findings	15
2.4.2	Track construction	16
2.4.3	Operation	17
2.4.4	Material properties	17
3	Coordinate systems and notation	18
4	The corrugation model	24
4.1	The dynamics	25
4.1.1	Assumptions and restrictions	25
4.1.2	Wheelset	28
4.1.3	Track	29
4.1.4	Contact mechanics	31
4.1.5	Excitation	36
4.1.6	Model for high frequency dynamics	36
4.2	The feedback mechanism	40
4.2.1	Assumptions and restrictions	40
4.2.2	Calculation of local wear eigenvalues	41
4.2.3	Analytical solution for local corrugation growth rate	42
4.2.4	Calculation of wear pattern	43
5	Limits of the linear model	46
6	The need for a sophisticated corrugation model	50
6.1	From receptances to global corrugation growth rate	50
6.1.1	Receptances	50
6.1.2	Local corrugation growth rate	51
6.1.3	Corrugation amplitude spectra	52
6.1.4	Global corrugation growth rate	54
6.2	Contact filter	56
7	Influence of operational parameters	60
7.1	Reference creepage	60
7.1.1	Lateral reference creepage	60
7.1.2	Combined lateral and longitudinal reference creepage	61
7.2	Wheel/rail geometry	66
7.3	Vehicle speed	72
7.4	Mixed traffic	76

8	Influence of track parameters	78
8.1	Ballast and pad parameters from field experiments	78
8.2	Pad parameters from laboratory tests	78
8.3	Influence of ballast parameters	81
8.3.1	Ballast stiffness	81
8.3.2	Ballast damping	82
8.4	Influence of pad parameters	84
8.4.1	Pad stiffness (constant damping)	85
8.4.2	Pad damping (constant stiffness)	86
8.4.3	Pad stiffness (constant relaxation time)	88
8.5	Optimization of track parameters of a test site	96
9	Influence of vehicle parameters	99
9.1	Different wheelset designs	99
9.2	Differently worn wheelsets	100
9.3	Axle load	101
10	Promising areas for further investigation	103
11	Conclusion	104
A	Results for different wheelsets	109
A.1	Characterization of wheelset mode shapes	109
A.2	Comparison with measurements and calculations of Thompson	111
A.3	The influence of brake discs on the dynamics of wheelsets	112
B	Results for different track	118
B.1	German track with S54-rail (DB track site)	118
B.2	German track with R65- and S49-rail (DR track site, [91, 89])	118
B.3	British track with BS113-rail	119
C	Technique for analysis of Hertzian normal contact	123
D	Standard input values for the corrugation model	125
D.1	Reference state values	125
D.2	Initial profile irregularity	126
E	Corrugation questionnaire	127
E.1	Part One – General description of the site	129
E.2	Part Two – Detailed site description	131
E.3	Part Three – Condition of the rail surface	136
E.4	Part Four – Notes on measuring technique and data collection	139
	Bibliography	140
