1	Introduction	1
2	Requirements for Different Design Levels	3
2.1	General concept	3
2.2	Design schemes	4
3	State-of-the-Art on Modelling Design Levels Related to Off-shore Structures	11
3.1	Introduction	11
3.2	Feasibility stage – limit state analyses	13
3.2.1	Bearing capacity	14
3.2.1.1	Elastic approach	14
3.2.1.2	Analysis based on failure lines	19
3.2.1.3	Numerical solution	22
3.2.2	Sliding resistance	22
3.2.3	Overturning	24
3.2.4	Overall stability	25
3.2.5	Effect of cyclic loading	25
3.2.6	Safety factors	27
3.2.7	Additional notes	28
	References	29
3.3	Deformation analysis	30
3.3.1	General	30
3.3.2	Analysis based on elastic theory	31
3.3.2.1	Vertical displacements	32
3.3.2.2	Rotation	32
3.3.2.3	Horizontal displacement	33
3.3.2.4	Increasing soil moduli with depth	34
3.3.2.5	Soil parameters	34
3.3.2.6	Critical statement	35
3.3.3	Finite-element analysis	35
3.3.4	Boundary element method	41
	References	43

3.4	Dynamic response analysis	44
3.4.1	General	44
3.4.2	Methods	44
3.4.3	Aproximations and soil parameters	46
	References	47
4	Instantaneous Pore-Pressure Model	49
4.1	Review of Existing Theories	49
4.1.1	Theoretical considerations	49
4.1.2	Experimental verification	54
4.1.3	Conclusions	56
4.2	'Potential' problem	57
4.3	'Consolidation' problem	61
4.3.1	Results of example calculations	63
4.4	'Storage' problem – analytical solution	69
4.4.1	Boundary conditions	70
4.4.2	Infinite thickness of homogeneous seabed layer	71
4.4.3	Finite thickness of the seabed layer	72
4.4.4	Results of example calculation	76
4.5	'Storage' problem – finite-element solution	85
4.5.1	Harmonic approximation of governing equations	86
4.5.2	Finite-element formulation	88
4.5.3	Implementation of the complex number properties	90
4.5.4	Approximation of integral equations using two-node finite element	91
4.5.5	Imposition of boundary conditions	96
4.5.6	Example calculations and comparison of their results	97
4.5.7	Conclusions	99
4.5.8	2-D finite-element model	100
	References	100
