Preface to the sixth edition	v
Preface to the first edition	vii
Notation	xv
1 Introduction	1
1.1 The scope and nature of chemical thermodynamics	1
1.2 Equilibrium in mechanical systems	2
1.3 Reversibility and equilibrium	4
1.4 Why we need thermodynamics	6
1.5 The mole	9
1.6 The perfect gas	10
2 Energy	13
2.1 Work	13
2.2 Heat and temperature	15
2.3 Measurement of temperature	16
2.4 Heat and molecular motion	16
2.5 Conservation of energy	17
2.6 State functions: a digression	19
2.7 Enthalpy	22
2.8 Heat capacity	24
Problems	25
3 Entropy and equilibrium	27
3.1 Reversibility and equilibrium: a recapitulation	27
3.2 Condition of equilibrium	29
3.3 Entropy	29

xii | Contents

3.4	Entropy as a state function	31
3.5	Entropy of expansion of a gas	32
3.6	Entropy changes accompanying heat flow	33
3.7	Entropy and equilibrium	34
3.8	A cosmological aside	34
3.9	Entropy as a function of pressure and temperature	35
3.10	Molecular basis of entropy	37
3.11	Statistical basis of the Second Law	39
3.12	Magnitudes of entropy changes	40
3.13	Heat engines	41
	Problems	43
4	Equilibrium in chemical systems	45
4.1	Free energy	45
4.2	Gibbs energy	47
4.3	Pressure-dependence of Gibbs energy	50
4.4	Temperature variation of Gibbs energy	51
4.5	Phase equilibria	52
4.6	Clapeyron equation	55
4.7	Clausius–Clapeyron equation	56
4.8	The vapour pressure of liquids	57
4.9	Chemical potential	60
4.10	Chemical potential and Gibbs energy	61
4.11	Equilibrium between gaseous reactants	64
4.12	Temperature-dependence of equilibrium constants	67
4.13	Effect of pressure on equilibrium constants	70
4.14	Basic results of chemical thermodynamics	73
4.15	Le Chatelier’s Principle	74
	Problems	75
5	Determination of thermodynamic quantities	77
5.1	Hess’s Law	77
5.2	Standard enthalpies of formation	79
5.3	Average bond energies	80
5.4	Temperature-dependence of enthalpy changes	81
5.5	Standard Gibbs energies of formation	82
5.6	Determination of Gibbs energy changes	83
5.7	Determination of entropies of substances	84

5.8	Example of the determination of thermodynamic quantities	86
5.9	Calculation of thermodynamic quantities at temperatures other than 298 K	92
5.10	Ellingham diagrams	94
5.11	Free-energy functions	96
	Problems	97
6	Ideal solutions	99
6.1	The ideal solution	99
6.2	Properties of truly ideal solutions	102
6.3	Mixtures of liquids	103
6.4	Ideal solutions of solids in liquids	105
6.5	Ideal dilute solutions	109
6.6	Colligative properties	110
6.7	Freezing-point depression	110
6.8	Elevation of boiling point	114
6.9	Osmotic pressure	118
6.10	Properties of the solute in dilute solutions	120
6.11	Solubility of solids	122
	Problems	123
7	Non-ideal solutions	125
7.1	The concept of activity	125
7.2	Activity of solids in liquids	127
7.3	Activity in aqueous solutions	128
7.4	Chemical equilibria in solution	132
7.5	Electrochemical cells	134
7.6	Standard electrode potentials	138
	Problems	143
8	Thermodynamics of gases	145
8.1	Expansion of a perfect gas	145
8.2	Irreversible expansion	146
8.3	Equation of state of gases	149
8.4	The Joule–Thomson experiment	150
8.5	Imperfect gases: fugacity	152
8.6	Calculation of fugacities	154
	Problems	155

9	The molecular basis of thermodynamics	157
9.1	Energy levels	157
9.2	Microstates	160
9.3	The Boltzmann factor	162
9.4	The behaviour of heat capacity	165
9.5	Partition functions	168
9.6	Entropy and the partition function	170
9.7	Calculation of the translational partition function	175
9.8	The rotational partition function	177
9.9	The vibrational partition function	178
9.10	Evaluation of the thermodynamic properties of gaseous nitrogen	179
9.11	Chemical equilibrium	181
	Problems	185
	Answers to problems	187
	Further reading	189
	Appendix 1: Thermochemical data at 298.15 K	191
	Appendix 2: Thermodynamic data for ions in aqueous solution at 298.15 K	195
	Appendix 3: Units and fundamental constants	197
	Periodic table of elements	201
	Index	203
