PREFACE	PAGE xiii
-------------------	--------------

PART I: WHAT SCIENCE DOES

CHAPTER I. INTRODUCTORY

THE CHALLENGE TO SCIENCE: The impact of events; should science be suppressed?; the revolt from reason	1
THE INTERACTION OF SCIENCE AND SOCIETY: Science as pure thought; science as power; disillusion; escape; the social importance of science; the scientist as worker; science for profit; the institution of science; can science survive?	3

CHAPTER II. HISTORICAL

SCIENCE, LEARNING AND CRAFT: Primitive science; agriculture and civilization; the town and the craftsman; the fatal separation of priest and craftsman; astronomy; medicine; the Greeks and science; science under the philosophers; Hellenistic Revival; Islam; the Middle Ages	13
THE BIRTH OF MODERN SCIENCE—SCIENCE AND TRADE: The combination of ingenuity and learning; technical advance; science built on craft knowledge; Italy and the first scientific societies; Holland, England, and the Royal Society; the discoveries and navigation; the first scientists; the Newtonian era	19
SCIENCE AND MANUFACTURE: The steam-engine; science and revolution—the Lunar Society; the great age of French science; the pneumatic revolution and chemical industry; the nineteenth century—science becomes a necessity; Germany enters the field; science as an institution—the idea of pure science	24
SCIENCE AND IMPERIAL EXPANSION: The War; collaboration of scientists; state science; the post-war period and the crisis	29
SCIENCE AND SOCIALISM	32

CHAPTER III. THE EXISTING ORGANIZATION OF SCIENTIFIC RESEARCH IN BRITAIN

University, Government and Industrial Research	35
RESEARCH IN THE UNIVERSITIES: Research workers; nature of research done; research in engineering; research in physics and chemistry; research in medical subjects; an unbalanced programme of research	36

	PAGE
SCIENTIFIC SOCIETIES: The Royal Society; the British Association .	41
GOVERNMENTAL SCIENTIFIC RESEARCH: The Department of Scientific and Industrial Research—the National Physical Laboratory; fuel research; food investigation; forest products and building; research associations; research grants	42
MEDICAL RESEARCH: The Medical Research Council; private medical research	48
AGRICULTURAL RESEARCH	50
SCIENCE IN INDUSTRY: expenditure; character of work	55
THE FINANCE OF RESEARCH: Endowment; government grants; administration; Treasury control; the character of research finance; the character of research expenditure	57
THE BUDGET OF SCIENCE	62

CHAPTER IV. SCIENCE IN EDUCATION

SCIENCE TEACHING IN THE PAST	71
SCIENCE IN SCHOOLS	73
SCIENCE IN THE UNIVERSITIES: The lecture system; specialization; the curriculum; examinations; medical education; engineering .	75
THE TRAINING OF THE RESEARCH WORKER: Financial difficulties; opportunities for research; the problem of getting on; the profession of research	82
POPULAR SCIENCE: The current influence of science; the isolation of science; scientific superstition; the pre-scientific attitude; the need for science and its suppression	86

CHAPTER V. THE EFFICIENCY OF SCIENTIFIC RESEARCH

Three aims for science—psychological, rational, and social . . .	94
THE IDEAL OF PURE SCIENCE: Science as escape; science and cynicism	95
THE TECHNICAL INEFFICIENCY OF SCIENCE: Bad organization; laboratory waste of skill; false economies; salaries of scientific workers	98
SCIENTIFIC INSTITUTES: University laboratories; effects of endowments; government laboratories	103
RESEARCH IN INDUSTRY: Secrecy; lack of freedom; low standard .	107
SCIENTIFIC INSTRUMENTS: Mass production; high prices	111
LACK OF CO-ORDINATION OF RESEARCH: Informal methods; lack of integration of different sciences; the Gerontocracy; need science be organized?	113

CONTENTS

vii

PAGE

SCIENTIFIC PUBLICATIONS: The burying of published work; the cost of publication; personal communication and travel	117
THE EFFECTS OF INEFFICIENT ORGANIZATION: Science in danger	120

CHAPTER VI. THE APPLICATION OF SCIENCE

The interaction of science and technics; the infiltration of science into industry; the time lag in the application of science	126
THE PROFITABILITY OF SCIENCE: Difficulties in financing research; the conditions for practical success; the problem of scale; waste and frustration of invention; constructive and remedial applications	131
INDUSTRIAL COMPETITION AND RESEARCH	136
MONOPOLY AND RESEARCH: Lack of incentive; obsolescence	138
THE STIFLING OF RESEARCH: Patents	141
CO-OPERATIVE INDUSTRIAL RESEARCH: Inter-industrial competition	147
ECONOMIC NATIONALISM AND RESEARCH: Secrecy; international monopolies	149
THE DISTORTION OF INDUSTRIAL RESEARCH	153
SCIENCE AND HUMAN WELFARE: Technological unemployment; the impossibility of plenty	155

CHAPTER VII. SCIENCE AND WAR

SCIENCE AND WAR IN HISTORY: Gunpowder; artillery and the Renaissance; war and the Industrial Revolution; the nineteenth century; science in the Great War; war creates state-organized science	163
WAR RESEARCH TO-DAY: What is war research?; the mechanization of war	173
SCIENCE AND ARMAMENTS: Heavy industry; aeroplane production; the chemical industry; explosives and poison gas	175
NATIONAL FOOD SUPPLIES	178
THE DIVERSION OF RESEARCH TO WAR USES: Military research; the scientist in war; totalitarian war preparation; air raid defence; the protection of the civil population	180
THE SCIENTIST FACES THE PROBLEM OF WAR: Scientists organize for Peace	185

CHAPTER VIII. INTERNATIONAL SCIENCE

SCIENCE AND CULTURE IN THE PAST: International science to-day	191
THE PROBLEM OF LANGUAGE	192

	PAGE
THE SCIENTIFIC WORLD AND ITS DIVISIONS: National characteristics in science	194
SCIENCE IN THE OLDER INDUSTRIAL COUNTRIES: English science; science in pre-Nazi Germany; science in France; science in Holland, Belgium, Switzerland, and Scandinavia; science in Austria and Czecho-Slovakia; science in Poland, Hungary, and the Balkans; science in Spain and Latin America	196
SCIENCE IN THE UNITED STATES	204
SCIENCE IN THE EAST: Science in India; science in Japan; science in China; science in Islamic countries	207
SCIENCE AND FASCISM: Science in Fascist Italy; Nazi science; the persecution of the Jews; the dragooning of science; all science for war; the distortion of science; science in danger	210
SCIENCE AND SOCIALISM: Science in the Soviet Union; science before the Revolution; early struggles; the scale of Soviet science; planning science; organization; how the system works; science in education and popular culture; character of Soviet science; dialectical materialism and science	221

PART II: WHAT SCIENCE COULD DO

CHAPTER IX. THE TRAINING OF THE SCIENTIST

THE REORGANIZATION OF SCIENCE: The need for expansion; organization and the preservation of freedom; the recruitment of scientists; vocational selection; a wide entry into scientific research; a directing authority for entrants	241
CHANGING THE TEACHING OF SCIENCE	245
SCIENCE IN SCHOOLS: A living curriculum; science for all	246
SCIENCE IN UNIVERSITIES: Research as a teaching method; science and culture; vocational teaching?; specialization; higher universities; research and teaching	248
REVISING THE CURRICULUM: Physics; chemistry; astronomy and geology; biology; medicine; the social sciences	252

CHAPTER X. THE REORGANIZATION OF RESEARCH

FIRST PRINCIPLES: Science as an occupation	261
SPECIALIZATION: The control of specialization	262
LABORATORY ORGANIZATION: The laboratory as basic unit; co-operative enterprise; the laboratory as a training centre; laboratory democracy; the director; the administrator; the representative; the raising of money; librarian; curator; mechanic and storekeeper; laboratory council; research programmes; dangers of organization; provision for growth; initiative in research; organization and freedom	265

THE GENERAL ORGANIZATION OF SCIENCE: Horizontal and vertical divisions in research; the place of the universities; the complexity of science; schemes of interconnection	278
ACADEMIES: Functions; guarantees of capacity; mode of election	280
TECHNICO-SCIENTIFIC INSTITUTES: Two-way communication between science and industry; the institutes and new production; personnel; physical and chemical sectors; biological sector; sociological institutes and planning	283
INDUSTRIAL LABORATORIES AND FIELD STATIONS: Experimental factories; field stations; the character of applied research; the control of obsolescence	286
THE APPLICATION OF SCIENCE UNDER CAPITALISM: Socialism and the condition of the advance of science	289

CHAPTER XI. SCIENTIFIC COMMUNICATION

THE FUNCTION OF SCIENTIFIC PUBLICATIONS: Categories of publication units; the problem of distribution; distribution service to supersede periodicals; photostat reproduction; how the system would work; abstracts; reports; control of abuses; immediate possibilities	292
THE INTERNATIONAL PROBLEM: Decentralization; a secondary scientific language?	301
THE IMPORTANCE OF PERSONAL CONTACTS: Facilitation of travel	303
POPULAR SCIENCE: Science and the Press; science through radio and cinema; books on science; world encyclopaedia; popular participation in science	304

CHAPTER XII. THE FINANCE OF SCIENCE

SCIENCE AND ECONOMIC SYSTEMS: Financial needs of science—elasticity and security	309
SCIENCE IN A PLANNED ECONOMY: Determination of the budget; internal distribution; the financing of laboratories; building up science; the utilization of ability; the status of the scientific worker; no external limitation of funds; optimum expenditure	310
FINANCING SCIENCE IN A CAPITALIST ECONOMY: Need for greater understanding between science and industry; the endowment of science; official objections; private benevolence; could science pay its way?; economic nationalism and planned science	316
THE FREEDOM OF SCIENCE: Frustration; science needs organization; scientists and the people	321

CHAPTER XIII. THE STRATEGY OF SCIENTIFIC ADVANCE

CAN SCIENCE BE PLANNED?: Flexibility; advance along the line; sticking points; widening the front; consolidating advances; the importance of theory; permanent revision; balance of fundamental and applied research	325
THE FIRST STAGE: A SURVEY OF SCIENCE: The world of nature and the world of man; need for effective social science	330
THE PROSPECTS OF SCIENCE: Tasks left undone	331
PHYSICS: The structure of matter; geophysics	332
CHEMISTRY: Metals; reactions; the reconstruction of chemistry; colloids and proteins	335
BIOLOGY: Biochemistry; biophysics; embryology; the nucleus and genetics; ecology; animal behaviour; animal societies	337
SOCIAL SCIENCE AND PSYCHOLOGY	341
THE FUTURE OF SCIENCE: Interactions	343

CHAPTER XIV. SCIENCE IN THE SERVICE OF MAN

HUMAN NEEDS: Primary needs—physiological and social	345
FOOD: New agriculture; bacterial and chemical food production; distribution; cookery	346
CLOTHING: Supersession of textiles	349
HOUSING: New materials; internal climate; domestic convenience; the city of the future; town and country; planning.	350
HEALTH: Control of disease; diseases of old age and death; population control; a great increase under good social conditions	353
WORK: The worker, not profit, as a prime consideration; machinery to remove, not create, drudgery; work as pleasure	356
PLAY: Remaking the world	358
PRODUCTION: Integration of industries in a rational society	359
MINING: Supersession of underground work; smelting—the new metals	361
POWER PRODUCTION: Capital saving; new generators; power storage; the application of power; hydrodynamics—rocket flight	363
ENGINEERING: Rational mechanism; intelligent machinery; civil engineering	366
CHEMICAL INDUSTRY: Planning substances for needs; food production; drugs; cosmetics; wastes; new materials; new processes	367

CONTENTS

xi
PAGE

TRANSPORT: Air transport; comfort in travel; goods transport; further possibilities	373
DISTRIBUTION: Food; commodities	375
COMMUNICATION: Elimination of drudgery; automatism	376
ADMINISTRATION AND CONTROL	378
GENERAL EFFECTS OF SCIENCE: Man's major tasks; the fulfilment of science or its frustration; the rejection of utopias; a new civilization—freedom and struggle; faith in Man	379
SCIENCE AND SOCIETY	382

CHAPTER XV. SCIENCE AND SOCIAL TRANSFORMATION

SOCIAL CONDITIONS AND SCIENCE	385
HOW SCIENCE CHANGES SOCIETY: Influence on productive methods; consciousness of frustration	385
THE SCIENTIFIC WORKER OF TO-DAY: Economic dependence; the tendency to conform; the scientific bent; science and religion; narrowness of vision; the gerontocracy of science	387
THE SCIENTIST AS CITIZEN: The impact of events; the crisis; the Five-Year Plan; Marxism and the History of Science; the coming of Fascism; the scientists' reaction; preparation for war	391
SOCIAL CONSCIOUSNESS: The scientist as ruler?	397
THE ORGANIZATION OF SCIENTISTS: The recognition of social responsibility; Associations of Scientific Workers	398
SCIENCE AND POLITICS: Neutrality impossible; the popular opinion of science; science and democracy; the Popular Front; how the scientist can help	402

CHAPTER XVI. THE SOCIAL FUNCTION OF SCIENCE

THE MAJOR TRANSFORMATIONS OF HISTORY: Society and civilization; the Scientific Revolution—the rôle of Capitalism; the social implications of science; the tasks of science in the transition period; preventable evils; discovery and satisfaction of needs	408
SCIENCE AND CULTURE	411
THE TRANSFORMATION OF SCIENCE: The problem of the origin of new things; dialectical materialism; the extension of rationality; the trend of the future; science as Communism	412
