*Preface*

## PART I OVERTURE

<b>1</b>	<b>Introduction</b>	3
1.1	Why a statistical theory of design?	3
1.2	History, computers and mathematics	4
1.3	The influence of analysis on design	5
1.4	Separate consideration of units and treatments	7
<b>2</b>	<b>Elementary ideas of blocking: the randomised block design</b>	9
2.1	Controlling variation in experimental units	9
2.2	The analysis of variance identity	12
2.3	Estimation of variance and the comparison of treatment means	19
2.4	Residuals and the meaning of error	23
2.5	The random allocation of treatment to units	24
2.6	Practical choices of blocking patterns	27
<b>3</b>	<b>Elementary ideas of treatment structure</b>	31
3.1	Choice of treatments	31
3.2	Factorial structure	32
3.3	Models for main effects and interactions	33
3.4	The analysis of variance identity	36
3.5	Interpretation of main effects and interactions	40
3.6	Advantages of factorial structures	42
<b>4</b>	<b>General principles of linear models for the analysis of experimental data</b>	45
4.1	Introduction and some examples	45
4.2	The principle of least squares and least squares estimators	46
4.3	Properties of least squares estimators	48
4.4	Overparameterisation, constraints and practical solution of least squares equations	52
4.5	Subdividing the parameters and the extra sum of squares	58

4.6	Distributional assumptions and inferences	64
4.7	Contrasts, treatment comparisons and component sums of squares	66
	<i>Appendix to Chapter 4</i>	72
4.A2	Least squares estimators for linear models	72
4.A3	Properties of least squares estimators	72
4.A4	Overparameterisation and constraints	75
4.A5	Partitioning the parameter vector and the extra SS principle	78
4.A6	Distributional assumptions and inferences	80
4.A7	Treatment comparisons and component sums of squares	85
<b>5</b>	<b>Computers for analysing experimental data</b>	88
5.1	Introduction	88
5.2	How general, how friendly	90
5.3	Requirements of packages for the analysis of experimental data	96
5.4	The factor philosophy of analysis programs	98
5.5	The regression model for analysis programs	101
5.6	Implications for design	102
	<b>PART II FIRST SUBJECT</b>	
<b>6</b>	<b>Replication</b>	107
6.0	Preliminary example	107
6.1	The need for replication	108
6.2	The completely randomised design	109
6.3	Different levels of variation	112
6.4	Identifying and allowing for different levels of variation	117
6.5	Sampling and components of variation	122
6.6	How much replication?	124
	Exercises 6	129
<b>7</b>	<b>Blocking</b>	130
7.0	Preliminary examples	130
7.1	Design and analysis for very simple blocked experiments	130
7.2	Design principles in blocked experiments	134
7.3	The analysis of block-treatment designs	142
7.4	Balanced incomplete block designs and classes of less balanced des	150
7.5	Orthogonality, balance and the practical choice of design	154
7.6	The analysis of within block and inter-block information	163
	Exercises 7	172
<b>8</b>	<b>Multiple blocking systems and cross-over designs</b>	176
8.0	Preliminary examples	176
8.1	Latin square designs and Latin rectangles	177
8.2	Multiple orthogonal classifications and sequences of experiments	181
8.3	Non-orthogonal row and column design	183
8.4	The practical choice of row and column design	192
8.5	Cross-over designs – time as a blocking factor	197

8.6	Cross-over designs for residual or interaction effects	201
	Exercises 8	208
<b>9</b>	<b>Randomisation</b>	214
9.1	What is the population?	214
9.2	Random treatment allocation	216
9.3	Randomisation tests	218
9.4	Randomisation theory of the analysis of experimental data	224
9.5	Practical implications of the two theories for the analysis of experimental data	229
9.6	Practical randomisation	231
9.7	Sequential allocation of treatments in clinical trials	237
	Exercises 9	242
<b>10</b>	<b>Covariance – extension of linear models</b>	245
10.0	Preliminary examples	245
10.1	The use of additional information	245
10.2	The general theory of covariance analysis	249
10.3	Covariance analysis for a randomised block design	251
10.4	Examples of the use of covariance analysis	254
10.5	Assumptions and implications of covariance analysis	261
10.6	Blocking or covariance	263
10.7	Spatial covariance and nearest neighbour analysis	266
	Exercises 10	270
<b>11</b>	<b>Model assumptions and more general models</b>	274
11.0	Preliminary examples	274
11.1	The model assumed for general linear model analysis	275
11.2	Examining residuals and testing assumptions	277
11.3	Transformations	283
11.4	More general statistical models for analysis of experimental data	286
11.5	Missing values and outliers	291
11.6	The separation of quantitative and qualitative information	297
	Exercises 11	301
<b>PART III SECOND SUBJECT</b>		
<b>12</b>	<b>Experimental objectives, treatments and treatment structures</b>	307
12.0	Preliminary examples	307
12.1	Different categories of treatment	308
12.2	Comparisons between treatments	309
12.3	Presentation of results	315
12.4	Qualitative or quantitative factors	316
12.5	Treatment structures	326
12.6	Incomplete structures and varying replication	331
12.7	Treatments as a sample	336
12.8	Screening and selection experiments	338
	Exercises 12	340

<b>13</b>	<b>Factorial structure and particular forms of effects</b>	345
13.0	Preliminary example	345
13.1	Factors with two levels only	345
13.2	Improved yield comparisons in terms of effects	352
13.3	Analysis by considering sums and differences	357
13.4	Factors with three or more levels	361
13.5	The use of only a single replicate	366
13.6	The use of a fraction of a complete factorial experiment	370
	Exercises 13	378
<b>14</b>	<b>Split unit designs and repeated measurements</b>	382
14.0	Preliminary examples	382
14.1	The practical need for split units	384
14.2	Advantages and disadvantages of split unit designs	389
14.3	Extensions of the split unit idea	393
14.4	Identification of multiple strata designs	402
14.5	Time as a split unit factor and repeated measurements	407
14.6	Systematic treatment variation within main units	414
	Exercises 14	417
<b>15</b>	<b>Incomplete block size for factorial experiments</b>	422
15.0	Preliminary examples	422
15.1	Small blocks and many factorial combinations	432
15.2	Factors with a common number of levels	439
15.3	Incompletely confounded effects	442
15.4	Partial confounding	455
15.5	The split unit design as an example of confounding	459
15.6	Confounding for general block size and factor levels	468
<b>16</b>	<b>Some mathematical theory for confounding and fractional replication</b>	470
16.0	Preliminary examples	470
16.1	The negative approach to confounding	471
16.2	Confounding theory for $2^n$ factorial structures	473
16.3	Confounding theory for other factorial structure; dummy factors	479
16.4	Confounding for $3^n$	485
16.5	Fractional replication	491
16.6	Confounding in fractional replicates	496
16.7	Confounding in row and column designs	502
	Exercises 16	509
<b>17</b>	<b>Quantitative factors and response functions</b>	514
17.0	Preliminary examples	514
17.1	The use of response functions in the analysis of data	515
17.2	Design objectives	517
17.3	Specific parameter estimation	521

17.4	Optimal design theory	526
17.5	Discrimination	528
17.6	Designs for competing criteria	530
17.7	Systematic designs	533
	Exercises 17	536
<b>18</b>	<b>Response surface exploration</b>	538
18.0	Preliminary examples	538
18.1	General estimation objectives	538
18.2	Some response surface designs based on factorial treatment structures	542
18.3	Prediction, rotatability and testing fit	549
18.4	Blocking and orthogonality	551
18.5	Sequential experimentation	554
18.6	Analysis of response surface experimental data	558
18.7	Experiments with mixtures	567
	Exercises 18	572
	<b>PART IV CODA</b>	
<b>0</b>	<b>Designing useful experiments</b>	577
0.0	Some more real problems	577
0.1	Design principles or practical design	579
0.2	Resources and experimental units	580
0.3	Treatments and detailed objectives	583
0.4	The resource equation	587
0.5	The marriage of resources and treatments	588
0.6	Three particular problems	595
0.7	The relevance of experimental results	603
0.8	Block $\times$ treatment and experiment $\times$ treatment interactions	605
	Exercises 0	609
	<b>References</b>	615
	<b>Index</b>	618
