Introduction	<i>page</i> 1
1 Space and systems of relations	5
1 Pure theories of reduction: Leibniz and Kant	5
2 Impure theories of reduction: outlines	7
3 A 'system of relations' theory: measurable qualities	10
4 Addition in a system of relations	12
5 Dimensions in a system of relations	14
6 What systems of relations really are	15
7 Space and sets	16
8 Parts of space and members of sets	19
9 Doubts about quality spaces	20
10 A non-qualitative relational space – the genealogical tree	24
2 Hands, knees and absolute space	29
1 Counterparts and enantiomorphs	29
2 Kant's pre-critical argument	30
3 Hands and bodies: relations among objects	32
4 Hands and parts of space	33
5 Knees and space: enantiomorphism and topology	35
6 A deeper premise: objects are spatial	38
7 Different actions of the creative cause	41
8 Can geometry explain things?	44
3 Euclidean and other shapes	50
1 Space and shape	50
2 Non-Euclidean geometry and the problem of parallels	51
3 Curves and surfaces	55
4 Intrinsic curvature and intrinsic geometry	57
5 Bending, stretching and intrinsic shape	60
6 Some curved two-spaces	61
7 Perspective and projective geometry	63
8 Transformations and invariants	66
9 Subgeometries of perspective geometry	68
10 More two-space models in E_3	71

4	Shapes and the imagination	<i>page</i> 74
1	Kant's idea: things look Euclidean	74
2	Two Kantian arguments: the visual challenge	75
3	Non-Euclidean perspective: the geometry of vision	77
4	Reid's non-Euclidean geometry of visibles	79
5	Delicacy of vision: non-Euclidean myopia	82
6	Non-geometrical determinants of vision: learning to see	83
7	Sight, touch and topology: finite spaces	86
8	Some topological ideas: enclosures	87
9	A warm-up exercise: the space of S_2	89
10	Non-Euclidean experience: the spherical space S_3	92
11	More non-Euclidean life: the toral spaces T_2 and T_3	94
5	The aims of conventionalism	99
1	Reichenbach's general strategy	99
2	Epistemological basis for conventions: standard language and problem language	101
3	Conventionalist commentary	103
4	Geometrical standard language: Erlanger program	105
5	The special problem of topology	107
6	Structure and ontology	108
7	The basic strategy again: description and redescription	109
8	Theory of meaning	110
9	Summary	111
6	Against conventionalism	113
1	The logic of belief and appearance	113
2	Belief and its bedrock objects	116
3	Basic data and standard language	117
4	Epistemological program and theory of mind	119
5	Some doubts about input and bedrock	120
6	Conventionalism without epistemology: some questions	123
7	Some general criticisms of conventionalism	127
8	Simplicity: an alleged merit of conventions	129
9	Constructing a theory	132
10	Analysis and meaning	135
11	Summing up	139

7	Reichenbach's treatment of topology	<i>page</i> 141
1	The geometry of mapping S_2 onto the plane	141
2	Reichenbach's convention: avoid causal anomalies	143
3	Breaking the rules: a change in the standard language	144
4	Local and global: a vague distinction	146
5	A second try: the torus	147
6	A new problem: convention and dimension	151
8	Measuring space: fact or convention?	155
1	A new picture of conventionalism	155
2	The conventionalist theory in outline: continuous and discrete spaces	156
3	Three kinds of metric function	160
4	Adequate versus trivial metrics	163
5	Intrinsic and extrinsic	165
6	Different metrics and conventions	168
7	An outline of criticisms	171
8	Dividing discrete and continuous spaces	174
9	Discrete intervals and sets of grains	177
10	Grünbaum and the simple objection	179
11	What metric stories are about	182
9	Intrinsic absolute spatial metric	186
1	Discovering a metric: units and standards	186
2	Determinates and determinables: the metric as a primitive	191
3	Basic structures: topology and coordinates	193
4	Tensors and vectors: features of space	195
5	Directions at points: vectors in topology	199
6	Affine structure: neighbouring directions	203
7	An analytical picture of affine structure	206
8	Metrical structure	209
10	The relativity of motion	213
1	Relativity as a philosopher's idea: motion as pure kinematics	213
2	Absolute motion as a kinematical idea: Newton's mechanics	216
3	A dynamical concept of motion: classical mechanics after Newton	219

4	Newtonian spacetime: classical mechanics as geometrical explanation	<i>page</i> 222
5	Kinematics in Special Relativity: the idea of variant properties	225
6	Spacetime in Special Relativity: a geometric account of variant properties	236
7	The relativity of motion in SR	240
8	General Relativity and the Clock Paradox	244
9	Time dilation: the geometry of 'slowing' clocks	247
10	Frames of reference in flat spacetime	251
11	What GR is all about	257
12	GR and the intrinsic geometry of spacetime	261
13	Geometry and motions: models of GR	265
	Bibliography	270
	Index	275
