

CONTENTS

PREFACE	vi
CHAPTER I. VECTOR ANALYSIS	1
Transformation of coordinates. Scalar fields: gradient. Vector fields. Line and surface integrals. Applications to vector analysis. Green's theorem. Discontinuities; surface derivatives. Uniqueness theorems and Green's function. Variation with time. Orthogonal curvilinear coordinates. Suffix notation and the summation convention. Cartesian tensors.	
CHAPTER II. THE SOLUTION OF SOME DIFFERENTIAL EQUATIONS	117
Laplace's equation in two and three dimensions. Solution in series of ordinary differential equations. The behaviour of the solution of a differential equation. Eigenvalues: Sturm-Liouville systems.	
CHAPTER III. SOME SPECIAL FUNCTIONS	176
Bessel functions. Legendre polynomials. Other special functions.	
CHAPTER IV. THE DIFFERENTIAL EQUATIONS OF FIELD LINES AND LEVEL SURFACES	232
Introduction. Field lines. Lagrange's partial differential equation. Level surfaces and orthogonal trajectories.	
CHAPTER V. MATRICES	253
Introduction and notation. Matrix algebra. The rank of a matrix: singular matrices. The reciprocal of a square matrix. Partitioned matrices. The solution of linear equations. Vector spaces. Eigenvalues and eigenvectors. Quadratic forms. Simultaneous reduction of quadratic forms. Multiple eigenvalues. Hermitian matrices.
