<b>Introduction</b>	ix
<b>1 The Role of Models in the Planning Process</b>	1
<i>The planning process; the nature of models; models in the planning process.</i>	
<b>2 Principles for the Design and Use of Models</b>	18
<i>Problem definition; model formulation; simulation and validation; application.</i>	
<b>3 Mathematical Preliminaries</b>	28
<i>Variables, constants and parameters; relationships and functions; subscripts; summation signs; exponents; solving equations.</i>	
<b>4 Linear Models</b>	41
<i>Simple linear relationships; multiple-variable models; measuring the strength of linear relationships; problems and limitations; examples of use.</i>	
<b>5 Gravity Models</b>	57
<i>Origin of gravity models; the modern form of the gravity model; gravity models as location models; problems and limitations; examples of use.</i>	

<b>6 The Lowry Model</b>	89
<i>Partial and general models; the general structure of the Lowry model; the economic base mechanism; the location of activities; the integration of the economic base and allocation mechanisms; problems and limitations; examples of use.</i>	
<b>7 Optimising Models</b>	113
<i>Optimising models as a planning tool; graphical solution of an optimising problem; problems and limitations.</i>	
<b>8 Conclusions</b>	130
<i>The characteristics of urban systems; the characteristics of existing urban models; a possible change of approach.</i>	
<b>Appendix: Calculation of Regression and Correlation Coefficients</b>	137
<i>Regression coefficients; correlation coefficient.</i>	
<b>Index</b>	141
