

UNIVERSITÄT-GESAMTHOCHSCHULE ESSEN

A CONSISTENT MODEL FOR SATURATED AND EMPTY POROUS MEDIA

J. Bluhm

November 1997

ISSN 0947-0921

FORSCHUNGSBERICHTE AUS DEM FACHBEREICH BAUWESEN

74

Contents

1. Introduction	3
2. The volume fraction concept	9
3. Kinematics	15
4. Balance equations and entropy inequality	17
4.1 Balance of mass	22
4.2 Balance of momentum	23
4.3 Balance of angular (moment of) momentum	25
4.4 Balance of energy	27
4.5 Entropy inequality for the mixture	29
5. Multiplicative decomposition of the deformation gradient of the constituent φ^α	31
5.1 Motivation	31
5.2 Establishing the range of the multiplicative decomposition of \mathbf{F}_α	37
5.3 Transport theorems and strain measurements	41
5.4 Discussion of volume strains in consideration of the multiplicative decomposition of \mathbf{F}_α	45
5.5 The influence of the multiplicative decomposition of \mathbf{F}_α with respect to the balance equation of mass	48
6. The closure problem	57
7. General constitutive modeling	67
7.1 Entropy inequality for the compressible ternary porous medium	67
7.2 Constitutive relations for the compressible ternary porous medium	73
7.3 Constitutive relations for porous media consisting of compressible and/or incompressible phases	83

8. Conclusions	95
9. References	97
Appendix A	103
A1 Entropy inequality for a compressible ternary porous medium	103
A2 Evaluation of the entropy inequality for a compressible ternary porous medium	116
A3 Summary of the results of the constitutive model for a ternary porous medium consisting of compressible phases	127
A4 Results of a simplified constitutive model for a ternary porous medium consisting of compressible phases	130
