List of Figures	ix
List of Tables	xv
Acknowledgments	xvii
Preface	xix
1 Introduction	1
1.1 When to model	2
1.2 What is a model	2
1.3 Formulation of a mathematical model	3
1.4 Solving the model equations	5
1.5 Drawing qualitative conclusions	6
1.6 Choosing parameters	7
1.7 Robustness	7
1.8 Analysis of results	9
1.9 Successes and failures of modeling	9
1.10 Final remarks	11
1.11 Other sources of information on mathematical modeling in biology	12
2 Introduction to biochemical kinetics	13
2.1 Transitions between states at the molecular level	13
2.2 Transitions between states at the population level	16
2.3 The law of mass action	23
2.4 Enzyme kinetics: Saturating and cooperative reactions	24
2.5 Simple models for polymer growth dynamics	27
2.6 Discussion	36
Exercises	37
3 Review of linear differential equations	43
3.1 First-order differential equations	44
3.2 Linear second-order equations	50
3.3 Linear second-order equations with constant coefficients	52
3.4 A system of two linear equations	55

3.5	Summary of solutions to differential equations in this chapter	61
	Exercises	61
4	Introduction to nondimensionalization and scaling	67
4.1	Simple examples	67
4.2	Rescaling the dimerization model	72
4.3	Other examples	76
	Exercises	79
5	Qualitative behavior of simple differential equation models	83
5.1	Revisiting the simple linear ODEs	83
5.2	Stability of steady states	86
5.3	Qualitative analysis of models with bifurcations	88
	Exercises	99
6	Developing a model from the ground up: Case study of the spread of an infection	103
6.1	Deriving a model for the spread of an infection	103
6.2	Dimensional analysis applied to the model	105
6.3	Analysis	107
6.4	Interpretation of the results	111
	Exercises	111
7	Phase plane analysis	115
7.1	Phase plane trajectories	115
7.2	Nullclines	117
7.3	Steady states	118
7.4	Stability of steady states	120
7.5	Classification of steady state behavior	122
7.6	Qualitative behavior and phase plane analysis	124
7.7	Limit cycles, attractors, and domains of attraction	132
7.8	Bifurcations continued	135
	Exercises	138
8	Quasi steady state and enzyme-mediated biochemical kinetics	145
8.1	Warm-up example: Transitions between three states	145
8.2	Enzyme-substrate complex and the quasi steady state approximation	152
8.3	Conditions for validity of the QSS	158
8.4	Overview and discussion of the QSS	165
8.5	Related applications	167
	Exercises	168
9	Multiple subunit enzymes and proteins: Cooperativity	173
9.1	Preliminary model for rapid dimerization	173
9.2	Dimer binding that induces conformational change: Model formulation	176
9.3	Consequences of a QSS assumption	178
9.4	Ligand binding to dimer	179

9.5	Results for binding and their interpretation: Cooperativity	183
9.6	Cooperativity in enzyme action	184
9.7	Monod–Wyman–Changeaux (MWC) cooperativity	185
9.8	Discussion	190
	Exercises	190
10	Dynamic behavior of neuronal membranes	195
10.1	Introduction	195
10.2	An informal preview of the Hodgkin–Huxley model	198
10.3	Working towards the Hodgkin–Huxley model	202
10.4	The full Hodgkin–Huxley model	214
10.5	Comparison between theory and experiment	216
10.6	Bifurcations in the Hodgkin–Huxley model	219
10.7	Discussion	222
	Exercises	222
11	Excitable systems and the FitzHugh–Nagumo equations	227
11.1	A simple excitable system	227
11.2	Phase plane analysis of the model	229
11.3	Piecing together the qualitative behavior	234
11.4	Simulations of the FitzHugh–Nagumo model	236
11.5	Connection to neuronal excitation	241
11.6	Other systems with excitable behavior	246
	Exercises	247
12	Biochemical modules	251
12.1	Simple biochemical circuits with useful functions	251
12.2	Genetic switches	257
12.3	Models for the cell division cycle	262
	Exercises	277
13	Discrete networks of genes and cells	283
13.1	Some simple automata networks	284
13.2	Boolean algebra	294
13.3	Lysis-lysogeny in bacteriophage λ	299
13.4	Cell cycle, revisited	304
13.5	Discussion	306
	Exercises	308
14	For further study	311
14.1	Nondimensionalizing a functional relationship	311
14.2	Scaled dimensionless variables	312
14.3	Mathematical development of the Michaelis–Menten QSS via scaled variables	316
14.4	Cooperativity in the Monod–Wyman–Changeaux theory for binding	318
14.5	Ultrasensitivity in covalent protein modification	320
14.6	Fraction of open channels, Hodgkin–Huxley Model	324

14.7	Asynchronous Boolean networks (kinetic logic)	327
	Exercises	333
15	Extended exercises and projects	337
	Exercises	337
A	The Taylor approximation and Taylor series	355
	Exercises	361
B	Complex numbers	363
	Exercises	365
C	A review of basic theory of electricity	367
	C.1 Amps, coulombs, and volts	367
	C.2 Ohm's law	370
	C.3 Capacitance	371
	C.4 Circuits	373
	C.5 The Nernst equation	375
	Exercises	377
D	Proofs of Boolean algebra rules	379
	Exercises	381
E	Appendix: XPP files for models in this book	385
	E.1 Biochemical reactions	385
	E.2 Linear differential equations	386
	E.3 Simple differential equations and bifurcations	387
	E.4 Disease dynamics models	389
	E.5 Phase plane analysis	389
	E.6 Chemical reactions and the QSS	391
	E.7 Neuronal excitation and excitable systems	392
	E.8 Biochemical modules	394
	E.9 Cell division cycle models	396
	E.10 Boolean network models	401
	E.11 Odell–Oster model of Exercise 15.7	403
	Bibliography	405
	Index	417
