<i>About the book</i>	<i>xxix</i>
Chapter 1: Computational thinking for mathematical biology	1
1.1 Benchmark problem: area of a bacterial colony	3
1.1.1 Using counting as a computational thinking approach	3
1.1.2 Connections to mathematical modeling	6
1.1.3 Monte Carlo as a computational thinking approach	7
1.2 Introduction to Monte Carlo methods	8
1.2.1 Law of Large Numbers	9
1.2.2 Central Limit Theorem	10
1.2.3 Monte Carlo methods for calculating probabilities	10
1.2.4 Monte Carlo methods for integration	11
1.2.5 Monte Carlo method: from pseudocode to Python	15
1.3 Revisiting the benchmark example	24
1.4 Discussion and connections	27
1.5 Exercises	28
References	31
Chapter 2: Modeling and computation for biological interactions	33
2.1 Benchmark problem: cell nutrient interaction	35
2.2 Foundational population dynamics models	37
2.2.1 Malthusian model	37
2.2.2 Verhulst logistic model	39
2.3 Numerical solution for first-order IVP	42
2.3.1 Euler's method	42
2.3.2 Taylor series methods	46

2.3.3	Runge-Kutta methods	47
2.4	Lotka-Volterra models	50
2.4.1	Implementing Lotka-Volterra system	53
2.4.2	Malthusian growth	54
2.4.3	Logistic growth	56
2.4.4	Mutualism models	58
2.4.5	Richardson's arms race model	59
2.4.6	A competition model	61
2.4.7	A model for revolution and epidemics	63
2.5	Revisiting the benchmark problem	66
2.6	Discussions and connections	69
2.7	Exercises	69
	References	73
Chapter 3: Understanding spread of infection and epidemic dynamics		75
3.1	Benchmark example: London boarding school	78
3.2	Epidemic dynamics: the SIR model	79
3.2.1	Deriving the SIR model	79
3.2.2	Insights from the SIR model	82
3.2.3	Severity of an epidemic	83
3.2.4	Solution to nonlinear equations	85
3.3	Modified SIR models	87
3.3.1	SIS epidemic model	87
3.3.2	SIR with vital dynamics	88
3.3.3	SEIR epidemic model	89
3.4	Least squares method	90
3.4.1	Normal equations	91
3.4.2	Multi-variate regression	98
3.5	Revisiting the benchmark example	102
3.6	Discussion and conclusions	108
3.7	Exercises	110
	References	112
Chapter 4: Modeling, analysis, and computation in epidemiology		115
4.1	Benchmark example: modeling addiction behavior	116
4.1.1	Modeling addiction journey without treatment	116
4.1.2	Modeling addiction journey with treatment	117
4.2	Mathematical analysis	118
4.2.1	Non-negativity of the solutions	119
4.2.2	Boundedness of the solutions	120
4.2.3	Disease free equilibrium	121
4.3	Basic reproduction number	122
4.3.1	Endemic equilibrium approach	122

4.3.2	Next generation matrix approach	124
4.3.3	Local asymptotic stability	125
4.4	Gradient descent method	127
4.5	Revisiting the benchmark example	136
4.6	Discussion and conclusions.....	143
4.7	Exercises.....	144
	References	145
Chapter 5: Foundations of optimal control theory in mathematical biology		147
5.1	Benchmark example: vaccination model.....	149
5.2	Introduction to optimal control	151
5.2.1	Optimization with an ODE constraint	152
5.3	Optimal control method for systems	156
5.3.1	Pontryagin's Maximum Principle.....	158
5.3.2	Forward-backward sweep method	159
5.4	Revisiting the benchmark example.....	163
5.4.1	Nonlinear cost of vaccination	164
5.4.2	Linear cost of vaccination	168
5.5	Discussion and conclusions.....	176
5.6	Exercises.....	177
	References	179
Chapter 6: Incorporating spatial dynamics into biological systems		181
6.1	Benchmark example: biomechanics of aneurysms	183
6.1.1	A mathematical model	184
6.1.2	Model for the CSF.....	184
6.1.3	Model for the blood pressure	186
6.1.4	Model for the arterial wall	186
6.2	The heat equation	187
6.2.1	Analytical solution via separation of variables.....	188
6.2.2	The explicit FTCS discretization	189
6.2.3	The implicit BTCS discretization.....	195
6.2.4	The implicit weighted average or theta-method.....	196
6.3	The wave equation	196
6.3.1	Analytical solution via separation of variables.....	197
6.3.2	Analytical solution via Laplace transforms	198
6.4	Revisiting the benchmark example.....	199
6.4.1	Analytical solution	199
6.4.2	Numerical solution	202
6.4.3	Computational experiments	205
6.5	Discussion and conclusions.....	210
6.6	Exercises.....	212
	References	215

Chapter 7: From deterministic to predictive modeling	217
7.1 Benchmark example: Abalone.....	218
7.2 Data science life cycle	219
7.2.1 Question or problem identification	220
7.2.2 Data acquisition and collection	221
7.2.3 Data cleaning and processing	223
7.2.4 Data interpretation and visualization	229
7.2.5 Data modeling and analysis	232
7.2.6 Data prediction and validation	236
7.3 Regression models	237
7.3.1 Linear regression	237
7.3.2 Ridge regression	239
7.3.3 Lasso regression	241
7.3.4 Decision trees	242
7.3.5 Random Forest.....	243
7.4 Revisiting the benchmark example.....	244
7.5 Discussion and conclusions.....	256
7.6 Exercises.....	257
References	258
Chapter 8: Data-driven classification for biological applications through machine learning	259
8.1 Benchmark example: BloodMNIST.....	261
8.2 Logistic regression	263
8.3 K-nearest neighbors	270
8.4 Foundations of neural networks	272
8.4.1 Activation functions	276
8.4.2 Optimization	277
8.4.3 Automatic differentiation	281
8.4.4 Universal Approximation Theorem.....	282
8.5 Revisiting the benchmark example.....	286
8.6 Discussion and conclusions.....	293
8.7 Exercises.....	294
References	296
Chapter 9: Physics-informed neural networks for predicting biological dynamics ...	297
9.1 Benchmark example: addiction with treatment.....	299
9.2 Physics-informed neural networks	301
9.3 PINNs for partial differential equations.....	303
9.3.1 Data-driven discovery	310
9.4 PINNs for epidemiological models	318
9.5 Revisiting the benchmark example.....	324
9.6 Discussion and conclusions.....	329

9.7 Exercises.....	331
References	334
Index	337
