

# Contents

<b>1</b>	<b>Introduction</b>	<b>1</b>
1.1	A short survey	1
1.2	What is a semiconductor?	5
1.3	Semiconducting materials	8
	Further reading	9
	Exercises	9
<b>2</b>	<b>Semiconductor crystals</b>	<b>11</b>
2.1	Crystal structure	11
2.2	Fabrication of crystals and wafers	11
2.2.1	Silicon	11
2.2.2	Germanium	13
2.2.3	Gallium arsenide	15
2.3	Layer by layer growth	15
2.3.1	Molecular beam epitaxy – MBE	15
2.3.2	Other methods	17
	Further reading	18
	Exercises	18
<b>3</b>	<b>Band structure</b>	<b>19</b>
3.1	Spinless and noninteracting electrons	19
3.2	Electron spin and the Zeeman hamiltonian	27
3.3	Spin-orbit interaction	29
3.4	Band structure of some semiconductors	31
3.5	Band structure near band extrema: k-p-theory	33
3.6	Spin-orbit interaction within k-p-theory	42
3.7	Thermal occupation of states	47
3.8	Measurements of the band structure	49
	Further reading	51
	Exercises	51
<b>4</b>	<b>Envelope functions and effective mass approximation</b>	<b>53</b>
4.1	Quantum mechanical motion in a parabolic band	53
4.2	Semiclassical equations of motion, electrons and holes	59
	Further reading	60
	Exercises	61

<b>5</b>	<b>Material aspects of heterostructures, doping, surfaces, and gating</b>	<b>63</b>
5.1	Band engineering	63
5.2	Doping, remote doping	72
5.3	Semiconductor surfaces	76
5.4	Metal electrodes on semiconductor surfaces	77
	Further reading	82
	Exercises	82
<b>6</b>	<b>Fabrication of semiconductor nanostructures</b>	<b>83</b>
6.1	Growth methods	83
6.2	Lateral patterning	88
	Further reading	93
<b>7</b>	<b>Electrostatics of semiconductor nanostructures</b>	<b>95</b>
7.1	The electrostatic problem	95
7.2	Formal solution using Green's function	96
7.3	Induced charges on gate electrodes	98
7.4	Total electrostatic energy	99
7.5	Simple model of a split-gate structure	100
	Further reading	102
	Exercises	102
<b>8</b>	<b>Quantum mechanics in semiconductor nanostructures</b>	<b>103</b>
8.1	General hamiltonian	103
8.2	Single-particle approximations for the many-particle problem	106
	Further reading	112
	Exercises	113
<b>9</b>	<b>Two-dimensional electron gases in heterostructures</b>	<b>115</b>
9.1	Electrostatics of a GaAs/AlGaAs heterostructure	115
9.2	Electrochemical potentials and applied gate voltage	117
9.3	Capacitance between top gate and electron gas	118
9.4	Fang-Howard variational approach	118
9.5	Spatial potential fluctuations and the theory of screening	122
9.5.1	Spatial potential fluctuations	122
9.5.2	Linear static polarizability of the electron gas	123
9.5.3	Linear screening	125
9.5.4	Screening a single point charge	128
9.5.5	Mean amplitude of potential fluctuations	132
9.5.6	Nonlinear screening	134
9.6	Spin-orbit interaction	135
9.7	Summary of characteristic quantities	138
	Further reading	140
	Exercises	141

<b>10 Diffusive classical transport in two-dimensional electron gases</b>	<b>143</b>
10.1 Ohm's law and current density	143
10.2 Hall effect	145
10.3 Drude model with magnetic field	146
10.4 Sample geometries	150
10.5 Conductivity from Boltzmann's equation	157
10.6 Scattering mechanisms	161
10.7 Quantum treatment of ionized impurity scattering	165
10.8 Einstein relation: conductivity and diffusion constant	169
10.9 Scattering time and cross-section	170
10.10 Conductivity and field effect in graphene	171
Further reading	173
Exercises	174
<b>11 Ballistic electron transport in quantum point contacts</b>	<b>175</b>
11.1 Experimental observation of conductance quantization	175
11.2 Current and conductance in an ideal quantum wire	177
11.3 Current and transmission: adiabatic approximation	182
11.4 Saddle point model for the quantum point contact	185
11.5 Conductance in the nonadiabatic case	186
11.6 Nonideal quantum point contact conductance	188
11.7 Self-consistent interaction effects	189
11.8 Diffusive limit: recovering the Drude conductivity	189
Further reading	192
Exercises	192
<b>12 Tunneling transport through potential barriers</b>	<b>193</b>
12.1 Tunneling through a single delta-barrier	193
12.2 Perturbative treatment of the tunneling coupling	195
12.3 Tunneling current in a noninteracting system	198
12.4 Transfer hamiltonian	200
Further reading	200
Exercises	200
<b>13 Multiterminal systems</b>	<b>201</b>
13.1 Generalization of conductance: conductance matrix	201
13.2 Conductance and transmission: Landauer-Büttiker approach	202
13.3 Linear response: conductance and transmission	203
13.4 The transmission matrix	204
13.5 $S$ -matrix and $T$ -matrix	205
13.6 Time-reversal invariance and magnetic field	208
13.7 Four-terminal resistance	209
13.8 Ballistic transport experiments in open systems	212
Further reading	223
Exercises	223

<b>14 Interference effects in nanostructures I</b>	<b>225</b>
14.1 Double-slit interference	225
14.2 The Aharonov–Bohm phase	226
14.3 Aharonov–Bohm experiments	229
14.4 Berry’s phase and the adiabatic limit	235
14.5 Aharonov–Casher phase and spin–orbit interaction induced phase effects	243
14.6 Experiments on spin–orbit interaction induced phase effects in rings	249
14.7 Decoherence	250
14.7.1 Decoherence by entanglement with the environment	250
14.7.2 Decoherence by motion in a fluctuating environment	253
14.8 Conductance fluctuations in mesoscopic samples	256
Further reading	262
Exercises	262
<b>15 Diffusive quantum transport</b>	<b>265</b>
15.1 Weak localization effect	265
15.2 Decoherence in two dimensions at low temperatures	267
15.3 Temperature-dependence of the conductivity	268
15.4 Suppression of weak localization in a magnetic field	269
15.5 Validity range of the Drude–Boltzmann theory	272
15.6 Thouless energy	273
15.7 Scaling theory of localization	275
15.8 Length scales and their significance	279
15.9 Weak antilocalization and spin–orbit interaction	280
Further reading	286
Exercises	286
<b>16 Magnetotransport in two-dimensional systems</b>	<b>287</b>
16.1 Shubnikov–de Haas effect	287
16.1.1 Electron in a perpendicular magnetic field	288
16.1.2 Quantum treatment of $\mathbf{E} \times \mathbf{B}$ -drift	292
16.1.3 Landau level broadening by scattering	293
16.1.4 Magnetocapacitance measurements	297
16.1.5 Oscillatory magnetoresistance and Hall resistance	298
16.2 Electron localization at high magnetic fields	301
16.3 The integer quantum Hall effect	305
16.3.1 Phenomenology of the quantum Hall effect	306
16.3.2 Bulk models for the quantum Hall effect	309
16.3.3 Models considering the sample edges	310
16.3.4 Landauer–Büttiker picture	311
16.3.5 Self-consistent screening in edge channels	318
16.3.6 Quantum Hall effect in graphene	320
16.4 Fractional quantum Hall effect	322
16.4.1 Experimental observation	322

16.4.2 Laughlin's theory	324
16.4.3 New quasiparticles: composite fermions	325
16.4.4 Composite fermions in higher Landau levels	327
16.4.5 Even denominator fractional quantum Hall states	328
16.4.6 Edge channel picture	329
16.5 The electronic Mach-Zehnder interferometer	330
Further reading	332
Exercises	333

<b>17 Interaction effects in diffusive two-dimensional electron transport</b>	<b>335</b>
17.1 Influence of screening on the Drude conductivity	335
17.2 Quantum corrections of the Drude conductivity	338
Further reading	339
Exercises	339

<b>18 Quantum dots</b>	<b>341</b>
18.1 Coulomb-blockade effect in quantum dots	341
18.1.1 Phenomenology	341
18.1.2 Experiments demonstrating the quantization of charge on the quantum dot	344
18.1.3 Energy scales	345
18.1.4 Qualitative description	349
18.2 Quantum dot states	354
18.2.1 Overview	354
18.2.2 Capacitance model	355
18.2.3 Approximations for the single-particle spectrum	359
18.2.4 Energy level spectroscopy in a perpendicular magnetic field	360
18.2.5 Spectroscopy of states using gate-induced electric fields	364
18.2.6 Spectroscopy of spin states in a parallel magnetic field	365
18.2.7 Two electrons in a parabolic confinement: quantum dot helium	366
18.2.8 Hartree and Hartree-Fock approximations	372
18.2.9 Constant interaction model	375
18.2.10 Configuration interaction, exact diagonalization	376
18.3 Electronic transport through quantum dots	377
18.3.1 Resonant tunneling	377
18.3.2 Sequential tunneling	387
18.3.3 Higher order tunneling processes: cotunneling	398
18.3.4 Tunneling with spin-flip: the Kondo effect in quantum dots	403
Further reading	406
Exercises	407

<b>19 Coupled quantum dots</b>	<b>409</b>
19.1 Capacitance model	410
19.2 Finite tunneling coupling	415
19.3 Spin excitations in two-electron double dots	417
19.3.1 The effect of the tunneling coupling	417
19.3.2 The effect of the hyperfine interaction	418
19.4 Electron transport	420
19.4.1 Two quantum dots connected in parallel	420
19.4.2 Two quantum dots connected in series	420
Further reading	425
Exercises	425
<b>20 Electronic noise in semiconductor nanostructures</b>	<b>427</b>
20.1 Classification of noise	427
20.2 Characterization of noise	428
20.3 Filtering and bandwidth limitation	431
20.4 Thermal noise	434
20.5 Shot noise	436
20.5.1 Shot noise of a vacuum tube	436
20.5.2 Landauer's wave packet approach	438
20.5.3 Noise of a partially occupied monoenergetic stream of fermions	440
20.5.4 Zero temperature shot noise with binomial distribution	441
20.6 General expression for the noise in mesoscopic systems	442
20.7 Experiments on shot noise in mesoscopic systems	445
20.7.1 Shot noise in open mesoscopic systems	445
20.7.2 Shot noise and full counting statistics in quantum dots	447
Further reading	450
Exercises	451
<b>21 Interference effects in nanostructures II</b>	<b>453</b>
21.1 The Fano effect	453
21.2 Measurements of the transmission phase	458
21.3 Controlled decoherence experiments	461
Further reading	467
Exercises	468
<b>22 Quantum information processing</b>	<b>469</b>
22.1 Classical information theory	470
22.1.1 Uncertainty and information	470
22.1.2 What is a classical bit?	473
22.1.3 Shannon entropy and data compression	475
22.1.4 Information processing: loss of information and noise	475
22.1.5 Sampling theorem	484
22.1.6 Capacitance of a noisy communication channel	486

22.2	Thermodynamics and information	488
22.2.1	Information entropy and physical entropy	488
22.2.2	Energy dissipation during bit erasure: Landauer's principle	492
22.2.3	Boolean logic	493
22.2.4	Reversible logic operations	495
22.3	Brief survey of the theory of quantum information processing	496
22.3.1	Quantum information theory: the basic idea	496
22.3.2	Qubits	498
22.3.3	Qubit operations	505
22.4	Implementing qubits and qubit operations	506
22.4.1	Free oscillations of a double quantum dot charge qubit	507
22.4.2	Rabi oscillations of an excitonic qubit	509
22.4.3	Quantum dot spin-qubits	512
	Further reading	519
	Exercises	520
<b>A</b>	<b>Fourier transform and Fourier series</b>	<b>521</b>
A.1	Fourier series of lattice periodic functions	521
A.2	Fourier transform	521
A.3	Fourier transform in two dimensions	521
<b>B</b>	<b>Extended Green's theorem and Green's function</b>	<b>523</b>
B.1	Derivation of an extended version of Green's theorem	523
B.2	Proof of the symmetry of Green's functions	523
<b>C</b>	<b>The delta-function</b>	<b>525</b>
	<b>References</b>	<b>527</b>
	<b>Index</b>	<b>545</b>
