

CONTENTS

Preface	v
Acknowledgments	ix
List of Symbols	xiii
Chapter 0 Introduction	1
0.1 Basic operator theory	1
0.2 The predual $\mathfrak{L}(\mathfrak{H})_*$	5
0.3 Three locally convex topologies on $\mathfrak{L}(\mathfrak{H})$	8
0.4 The double commutant theorem	11
Chapter 1 The Murray - von Neumann Classification of Factors	19
1.1 The relation $\dots \sim \dots$ (rel M)	19
1.2 Finite projections	22
1.3 The dimension function	27
Chapter 2 The Tomita - Takesaki Theory	36
2.1 Noncommutative integration	37
2.2 The GNS construction	39
2.3 The Tomita-Takesaki theorem (for states)	45
2.4 Weights and generalized Hilbert algebras	52
2.5 The KMS boundary condition	63
2.6 The Radon-Nikodym theorem and conditional expectations	73
Chapter 3 The Connes Classification of Type III Factors	84
3.1 The unitary cocycle theorem	85
3.2 The Arveson spectrum of an action	93
3.3 The Connes spectrum of an action	102
3.4 Alternative descriptions of $\Gamma(M)$	108

Chapter 4	Crossed-Products	114
4.1	Discrete crossed-products	115
4.2	The modular operator for a discrete crossed-product	122
4.3	Examples of factors	132
4.4	Continuous crossed-products and Takesaki's duality theorem	148
4.5	The structure of properly infinite von Neumann algebras	155
Appendix:	Topological Groups	161
