Preface by Robert Hermann	iii
Preface	v
Chapter I: ALGEBRAIC FUNCTIONS OF ONE VARIABLE	1
I. Definitions. Circular Systems	2
1. Mondromy theorem	2
2. Algebraic functions and the corresponding Riemann surfaces	4
3. Determination of ramification points. Puiseux's method	11
4. Examples	17
5. The theorem and surfaces of Lüroth	19
6. A topological transformation of the Lüroth surface	23
II. The Connectivity of Riemann Surfaces. The genus	27
7. Theorems on connectivity	27
8. The order of connectivity of a surface	30
9. The genus. Riemann's formula	33
10. Line of divisions. Examples	35
III. Birational Transformations. Applications	37
11. Cycles. Birational transformations of the plane to the plane, or Cremona transformations	37
12. Nöther's theorem. An application	42
13. Birational transformations of curves to curves. Bertini's theorem	46
14. The intersection of two cycles. Bezout's theorem	51
15. The class genus and multiple points	56
16. An application of Bertini's theorem to curves of genus 0 and 1	61
Chapter II. ON ABELIAN INTEGRALS. PROBLEMS OF INVERSION AND UNIFORMISATION	63
I. Analytic Functions on a Riemann Surface	63
17. Uniform functions on a Riemann surface	63
18. The Cauchy integral	66
19. Rational fractions	69
II. Abelian Integrals	71
20. Periods of abelian integrals	71
21. The general properties. The classification into three kinds	76
22. Integrals of the first kind	77
23. Integrals of the first kind that are linearly independent. Riemann's formula	81
24. Integrals of the second kind and integrals of the third kind	81

	<u>Page</u>
III. Abel's Theorem. Applications	87
25. Differential form	87
26. Integral form of the theorem	88
27. Geometric applications. Angular properties	93
28. Properties relative to distances and areas	94
29. Arcs of the direction curves	96
IV. Problems of Inversion and Uniformisation	97
30. On the Jacobi inversion problem and abelian functions	97
31. On the Riemann inversion problem and uniformisation	99
33. Picard's theorem on uniformisation	103
 Chapter III: ANALYTIC FUNCTIONS OF SEVERAL VARIABLES. THE METHOD OF THE MAJORANT FUNCTIONS	 109
I. Power Series in Several Variables	109
34. Series with positive coefficients and variables	109
35. Series with arbitrary terms. The associated circles of convergence	114
36. Properties of the sum. Analytic functions	117
37. The case of two real variables. An example of harmonic functions	121
38. Majorant functions	124
II. Implicit Analytic Functions. Analytic Curves and Surfaces	125
39. Function of one variable	125
40. The case of p equations in p unknowns	129
41. Analytic curves	131
42. Analytic surfaces	133
43. Lagrange's formula. The methods of Laplace and Hermite	135
44. A remark on the solutions of implicit functions	139
III. An Application of the Method of Majorant Functions to Differential Equations	140
45. The case of a single equation	140
46. Unicity of the solution. Dependence on the initial conditions. The integrating factor	142
47. System of first order equations	147
48. Equations of order n	150
49. The case of linear systems	152
IV. On the Theory of Holomorphic Functions of Two Variables Following Poincaré	155
50. Monogeneous functions of two variables	155
51. Extension of Cauchy's formula. An application. The theorem of Weierstrass	157
 Chapter IV: THE THEORY OF CONTACT ENVELOPES	 161
I. The Theory of Contact	161
52. Definition of the order of contact	161
53. The contact of two curves	163
54. The contact of two surfaces	168
55. The contact of a curve and a surface	170
56. Vectorial notations	172
57. Osculation	173

	<u>Page</u>
II. The Theory of Envelopes	178
58. Envelopes of plane curves	178
59. Envelopes of surfaces depending on one parameter	182
60. Envelopes of surfaces depending on two parameters	186
61. Envelopes of space curves depending on one parameter	190
62. Turning point	193
 Chapter V: THE ELEMENTARY THEORY OF DIFFERENTIAL EQUATIONS	 197
I. Equations of the First Order	198
63. Equations with variables separable. Examples	198
64. Euler equations	201
65. Homogeneous equations	203
66. Linear equations. The equations of Bernoulli and Jacobi	206
67. The Riccati equation	211
68. The integration of total differentials. The integrating factor	213
69. Nonsolvable equations. The equations of Lagrange and Clairut	215
70. The singular integral. Lie's geometric interpretation	219
II. Equations of Order Greater than One	222
71. The equation $y^{(n)} = f(x)$	222
72. Simple cases where the order is reduced	223
73. Simplification by differentiation	227
74. An example of integration by elliptic functions	230
75. The differential equation of a family of curves	231
III. Linear Differential Equations	
76. Definitions. General properties. The Wronskian	233
77. Fundamental system of solutions. The general integral	237
78. Equations with a second member. The method of the variation of constants	293
79. An application to equations with constant coefficients	241
80. Equations with constant coefficients with a second member	246
IV. Systems of Linear Equations	248
81. The canonical system	248
82. Fundamental systems of solutions	249
83. Reduction of order	253
84. Equations with second members	254
85. Application to equations with constant coefficients. Homogeneous systems	255
86. Linear systems with constant coefficients with second members	261
87. The Jacobi equation	263
 Chapter VI: LINEAR DIFFERENTIAL EQUATIONS IN THE COMPLEX DOMAIN	 265
I. An Application of the Existence Theorems	265
88. Solutions in the general case	265
89. Fundamental systems of solutions	266
90. Extension of the results obtained in the real case	268
91. D'Alembert's method	269
92. Euler equations	270

	<u>Page</u>
II. Homogeneous Equations with Uniform Coefficients	272
93. Permutation of the solutions about isolated singularities	272
94. The case where the equation in s has multiple roots	276
95. The theorems of Fuchs	281
96. The determinantal equation	285
97. A necessary and sufficient condition for the equation to be of the first Fuchsian type. An application	288
III. Applications	290
98. Equations with two singularities	290
99. Halphen's equations	292
100. Picard's equations	297
101. Lamé's equations	303
IV. The Method of Integration of Laplace	306
102. Laplace equations	306
103. Integration of the Laplace equation in the general case	309
104. Asymptotic expansions	314
105. Equations whose coefficients are polynomials	316
V. Various Results	320
106. Solutions common to two linear equations	320
107. The group of a linear equation	322
108. The adjoint equation	323
109. Equations with algebraic coefficients	324
Chapter VII: THE STUDY OF LINEAR DIFFERENTIAL EQUATIONS OF THE SECOND ORDER	327
I. The Gauss Equation and Hypergeometric Functions	327
110. An equation of the second order with three regular singularities	327
111. The hypergeometric function $F(\alpha, \beta, \gamma, x)$	329
112. Extension of the solutions	332
113. Jacobi polynomials	336
114. The representation of $F(\alpha, \beta, \gamma, x)$ by an integral	339
115. Hypergeometric integrals	340
116. An application to conformal representation	341
117. Degeneracies of the Gauss equation. Laguerre polynomials	344
118. Hermite polynomials	345
II. Legendre Equations and Functions	347
119. Legendre equation. The formulae of Schläfli and Laplace	347
120. The general solution of the Legendre equation	349
121. Heine's formula	351
122. Neumann's theorem	353
123. Legendre functions regarded as spherical functions	357
III. Bessel Equations and Functions	358
124. The Bessel differential equation and functions	358
125. Recurrence formulae	361
126. Schläfli's formula. The generating function of $J_n(x)$	362
127. Neumann's theorem	364
128. An application of the Laplace method	367

	<u>Page</u>
Chapter VIII: NONLINEAR DIFFERENTIAL EQUATIONS IN THE COMPLEX DOMAIN	373
I. The Local Studies of the Singularities. The Theorems of Briot and Bouquet	373
129. The case where the differential coefficient becomes infinite	373
130. The case where the differential coefficient is indeterminate. The general case	375
131. The case where λ is a positive integer	378
132. The general case	379
133. The case of differential systems	381
II. Singularities of Equations of the First Order	383
134. Painlevé's theorem	383
135. Rational equations whose solutions do not have any mobile algebraic critical points	385
136. Remarks on the constants of integration	386
137. The theorem of Boutroux on the growth of solutions of $y' = P(y)$	387
138. Theorems of Malmquist	390
139. Algebraic equations in y and y' with uniform solutions. The theorems of Hermite and Briot and Bouquet	392
140. An application to binomial equations	395
141. Poincaré's theorem	398
III. Equations of Order Greater than 1. Painlevé's Theorem. Painlevé's Equations and Functions	399
142. Second order equations with fixed critical points. Painlevé's method	399
143. An application to the equation $y'' = R(x, y, y')$	402
144. Reduction of the equation corresponding to $A(x, y) = 0$	407
145. Painlevé's equation $y'' = 6y^2 + x$	412
146. Other equations of Painlevé. Irreducibility	418
IV. Singular Integrals	419
147. Singular integrals of algebraic equations of the first order	419
148. Examples and complements	424
149. Singular integrals of differential systems	426
150. An application and examples	430
Chapter IX: DIFFERENTIAL EQUATIONS IN THE REALS	433
I. Existence Theorems. The Method of Successive Approximations of Picard	433
151. The existence of solutions by means of the Lipschitz condition	433
152. Unicity of the solution. The dependence on the initial conditions	437
153. First integrals. Equations with variations	440
154. Extension of the solutions. The case of linear systems	443
155. The case where the functions are analytic	445
II. First Integrals. The Multiplier. Invariant Integrals	446
156. First integrals	446
157. Integrable combinations. Examples	448
158. The Jacobi multiplier	451
157. The invariant integrals of Poincaré	454

	<u>Page</u>
III. Cauchy's Method. Arzel's Theorem. Approximate Integration	457
160. Arzela's theorem on equicontinuous functions	457
161. Cauchy's method. Arzela's theorem	459
162. The theorem of Cauchy-Lipschitz	461
163. Practical methods of approximation. Newton's formula. The method of Adams	462
164. The case of equations of greater order	465
IV. The Theory of Lie	466
165. Continuous point groups with one parameter	466
166. Infinitesimal transformations of the group	471
167. The extended group	472
168. An application to differential equations of the first order	474
169. Higher order equations. Groups with several parameters	477
 Chapter X: FIRST AND SECOND ORDER EQUATIONS IN THE REALS	 479
I. The Study of the Solutions of First Order Equations in the Neighbourhood of Singular Points of the Equation	479
170. The study of a certain simple example	479
171. The study of the general case, when the roots of the equation in x are real and of the same sign	481
172. The case where the roots are imaginary	485
173. The case where the roots of the equation in x are real and of opposite signs	490
174. The case of rational equations. The theorems of Poincaré	493
175. Bendixson's method	496
II. The General Theorem of Poincaré	498
176. The general problem. Projection onto the sphere. Characteristics	498
177. Singular points of the system of characteristics. Poincaré's relation between the number of nodes, cols (saddle points) and foci	499
178. The form of the characteristics. The theory of contacts. Boundary cycles	504
179. Extension of the method and results	509
III. Sturm-Liouville Equations	510
180. The Sturm-Liouville boundary problem; the reduced equation	510
181. Theorems of Sturm	512
182. An application to Bessel functions	514
183. An equation containing one parameter	515
184. Orthogonality of the sequence of fundamental solutions. Closed sequences	517
185. Applications and extensions	521
 Chapter XI: CALCULUS OF VARIATIONS	 523
I. The Case of Simple Integrals. Extremals	523
186. Outline of the problem	523
187. Determining the necessary conditions	524
188. The first fundamental lemma of the calculus of variations. The Euler equation. Extremals	526
189. Particular cases. Change of variables. Examples	527
190. The objection and lemma of DuBois Reymond	532

	<u>Page</u>
II. Study of the case where f does not depend on y	534
191. Sufficient condition for the absolute minimum. The figurative. Discontinuous solutions	534
192. Examples. Newton's problem	538
III. Extremum Conditions in the General Case	541
193. The first variation in general	541
194. Variational problems with variable limits. Transversals	544
195. Necessary conditions for the extremum. The conditions of Weierstrass and Legendre	549
196. The field of extremals. Hilbert's theorem. The sufficient conditions of Weierstrass and Legendre	553
197. Conjugate foci. The Jacobi condition. Strict extrema, weak extrema. Absolute extrema	556
198. Examples and various remarks	557
IV. Examples of Several Variational Problems. First Order Conditions	561
199. The case of several unknown functions	561
200. Isoperimetric problems	567
201. The case of double integrals. Minimal surfaces	570
202. The parametric form. Geodesiques	571
203. Canonical equations	574
