

TABLE OF CONTENTS

<u>Introduction</u>	v
<u>Table of Contents</u>	xv
<u>Chapter 1 : Elliptic Operators</u>	
Orientation	1
1. <u>Setting of the "model" problem</u>	2
1.1 Setting of the problem (I)	2
1.2 Setting of the problem (II):boundary conditions	4
1.3 An example: a one-dimensional problem	8
2. <u>Asymptotic expansions</u>	11
2.1 Orientation	11
2.2 Asymptotic expansions using multiple scales	12
2.3 Remarks on the homogenized operator	16
2.4 Justification of the asymptotic expansion for Dirichlet's boundary conditions	19
2.5 Higher order terms in the expansion	21
2.6 Extensions	22
3. <u>Energy proof of the homogenization formula</u>	23
3.1 Orientation: statement of the main result	23
3.2 Proof of the convergence theorem	24
3.3 A remark on the use of the "adjoint expansion"	28
3.4 Comparison results	31

4.	<u>L^p estimates</u>	35
4.1	Estimates for the Dirichlet problem	35
4.2	Reduction of the equation	38
4.3	Proof of Theorem 4.2	40
4.4	Local estimates	44
4.5	Extensions	46
5.	<u>Correctors</u>	49
5.1	Orientation	49
5.2	Structure of the first corrector: Statement of theorem	49
5.3	Proof of Theorem 5.1	53
5.4	First order system and asymptotic expansion	59
5.5	Correctors: Error estimates for Dirichlet's problem	65
6.	<u>Second order elliptic operators with non-uniformly oscillating coefficients</u>	71
6.1	Setting of the problem and general formulas	71
6.2	Homogenization of transmission problems	77
6.3	Proof of Theorem 6.1	82
6.4	Another approach to Theorem 6.1	84
7.	<u>Complements on boundary conditions</u>	87
7.1	A remark on the nonhomogeneous Neumann's problem	87
7.2	Higher order boundary conditions	89
7.3	Proof of (7.6), (7.7)	94

8.	<u>Reiterated homogenization</u>	96
8.1	Setting of the problem: Statement of main result.....	96
8.2	Approximation by smooth coefficients	103
8.3	Asymptotic expansion	108
8.4	Proof of the reiteration formula for smooth coefficients	112
8.5	Correctors	116
9.	<u>Homogenization of elliptic systems</u>	117
9.1	Setting of the problem	117
9.2	Statement of the homogenization procedure	120
9.3	Proof of the homogenization theorem	123
9.4	Correctors	126
10.	<u>Homogenization of the Stokes equation</u>	129
10.1	Orientation	129
10.2	Statement of the problem and the homogenization theorem	129
10.3	Proof of the homogenization theorem	132
10.4	Asymptotic expansion	136
11.	<u>Homogenization of equations of Maxwell's type</u>	138
11.1	Setting of the problem	138
11.2	Asymptotic expansions	140
11.3	Another asymptotic expansion	144
11.4	Compensated compactness	147
11.5	Homogenization theorem	150
11.6	Zero order term	155
11.7	Remark on a regularization method	157

12.	<u>Homogenization with rapidly oscillating potentials</u>	158
12.1	Orientation	158
12.2	Asymptotic expansion	159
12.3	Estimates for the spectrum and homogenization	161
12.4	Correctors	167
12.5	Almost periodic potentials	168
12.6	Neumann's problem	170
12.7	Higher order equations	173
12.8	Oscillating potential and oscillatory coefficients	176
12.9	A phenomenon of uncoupling	179
13.	<u>Study of lower order terms</u>	181
13.1	Orientation	181
13.2	Asymptotic expansion	183
13.3	Energy estimates	185
14.	<u>Singular perturbations and homogenization</u>	188
14.1	Orientation	188
14.2	Asymptotic expansion	189
14.3	Homogenization with respect to Δ^2	191
15.	<u>Non-local limits</u>	194
15.1	Setting of the problem	194
15.2	Non-local homogenized operator	196
15.3	Homogenization theorem	199
16.	<u>Introduction to non-linear problems</u>	200
16.1	Formal general formulas	200
16.2	Compact perturbations	202
16.3	Non-compact perturbations	203
16.4	Non-linearities in the higher derivatives	206

17.	<u>Homogenization of multi-valued operators</u>	207
17.1	Orientation	207
17.2	A formal procedure for the homogenization of problems of the calculus of variations	209
17.3	Unilateral variational inequalities	214
18.	<u>Comments and problems</u>	218
	<u>Bibliography</u>	228

Chapter 2 : Evolution Operators

	Orientation	233
1.	<u>Parabolic operators: Asymptotic expansions</u>	234
1.1	Notations and orientation	234
1.2	Variational formulation	235
1.3	Asymptotic expansions: Preliminary formulas	243
1.4	Asymptotic expansions: The case $k = 1$	245
1.5	Asymptotic expansions: The case $k = 2$	246
1.6	Asymptotic expansions: The case $k = 3$	248
1.7	Other form of homogenization formulas	250
1.8	The role of k	252
2.	<u>Convergence of the homogenization of parabolic equations</u>	253
2.1	Statement of the homogenization result	253
2.2	Proof of the homogenization when $k = 2$	253
2.3	Reduction to the smooth case	257
2.4	Proof of the homogenization when $0 < k < 2$	259
2.5	Proof of the homogenization when $k > 2$	266
2.6	Proof of the homogenization formulas when $a_{ij} \in L^\infty(\mathbb{R}_Y^n \times \mathbb{R}_T)$ using L^p estimates	269
2.7	The L^p estimates	271
2.8	The adjoint expansion	276

2.9	Use of the maximum principle	277
2.10	Higher order equations and systems	278
2.11	Correctors	282
2.12	Non-linear problems	287
2.13	Remarks on averaging	293
3.	<u>Evolution operators of hyperbolic, Petrowsky or Schrödinger type</u>	299
3.1	Orientation	299
3.2	Linear operators with coefficients which are regular in t	300
3.3	Linear operators with coefficients which are irregular in t	304
3.4	Asymptotic expansions (I)	306
3.5	Asymptotic expansions (II)	308
3.6	Remarks on correctors	312
3.7	Remarks on nonlinear problems	314
3.8	Remarks on Schrödinger type equations	317
3.9	Nonlocal operators	318
4.	<u>Comments and problems</u>	325
	<u>Bibliography</u>	342

Chapter 3: Probabilistic Problems and Methods

	<u>Orientation</u>	345
1.	<u>Stochastic differential equations and connections with partial differential equations</u> ..	348
1.1	Stochastic integrals	348
1.2	Itô's formula	350
1.3	Strong formulation of stochastic differential equations	351
1.4	Connections with partial differential equations	353

2.	<u>Martingale formulation of stochastic differential equations</u>	357
2.1	Martingale problem	357
2.2	Weak formulation of stochastic differential equations ..	359
2.3	Connections with P. D. E.	361
3.	<u>Some results from ergodic theory</u>	364
3.1	General results	364
3.2	Ergodic properties of diffusions on the torus	370
3.3	Invariant measure and the Fredholm alternative	377
4.	<u>Homogenization with a constant coefficients limit operator</u>	383
4.1	Diffusion without drift	384
4.2	Diffusion with unbounded drift	399
4.3	Convergence of functionals and probabilistic proof of homogenization	405
5.	<u>Analytic approach to the problem (4.76)</u>	414
5.1	The method of asymptotic expansions	414
5.2	The method of energy	419
6.	<u>Operators with locally periodic coefficients</u>	429
6.1	Setting of the problem	429
6.2	Probabilistic approach	431
6.3	Remarks on the martingale approach and the adjoint expansion method	442
6.4	Analytic approach to problem 6.5	444
7.	<u>Reiterated homogenization</u>	455
7.1	Setting of the problem	455
7.2	Proof of Theorem 7.1	463

8.	<u>Problems with potentials</u>	467
8.1	A variant of Theorem 6.3	467
8.2	A general problem with potentials	470
9.	<u>Homogenization of reflected diffusion processes</u>	475
9.1	Setting of the problem	475
9.2	Proof of convergence	478
9.3	Applications to partial differential equations	483
10.	<u>Evolution problems</u>	488
10.1	Notation and setting of problems	488
10.2	Fredholm alternative for an evolution operator	489
10.3	Case $k < 2$	496
10.4	Case $k = 2$	505
10.5	Case $k > 2$	509
10.6	Applications to parabolic equations	515
11.	<u>Averaging</u>	516
11.1	Setting of the problem	516
11.2	Proof of Theorem 11.1	518
11.3	Remarks on generalized averaging	525
12.	Comments and problems	529
	<u>Bibliography</u>	534

Chapter 4 : High Frequency wave Propagation in Periodic Structures.

	<u>Orientation</u>	537
1.	<u>Formulation of the problems</u>	538
1.1	High frequency wave propagation	538
1.2	Propagation in periodic structures	545

2.	<u>The W. K. B. or geometrical optics method</u>	
2.1	Expansion for the Klein-Gordon equation	547
2.2	Eiconal equation and rays	550
2.3	Transport equations	552
2.4	Connections with the static problem	556
2.5	Propagation of energy	557
2.6	Spatially localized data	559
2.7	Expansion for the fundamental solution	563
2.8	Expansion near smooth caustics	565
2.9	Impact problem	566
2.10	Symmetric hyperbolic systems	568
2.11	Expansions for symmetric hyperbolic systems (low frequency)	574
2.12	Expansion for symmetric hyperbolic systems (probabilistic)	581
2.13	Expansion for symmetric hyperbolic systems (high frequency)	587
2.14	W. K. B. for dissipative symmetric hyperbolic systems ..	600
2.15	Operator form of the W. K. B.	609
3.	<u>Spectral theory for differential operators with periodic coefficients</u>	614
3.1	The shifted cell problem for a second order elliptic operator	614
3.2	The Bloch expansion theorem	616
3.3	Bloch expansion for the acoustic equations	618
3.4	Bloch expansion for Maxwell's equations	619
3.5	The dynamo problem	620
3.6	Some nonselfadjoint problems	621

4.	<u>Simple applications of the spectral expansion</u>	
4.1	Lattice waves	627
4.2	Schrödinger's equation	629
4.3	Nature of the expansion	632
4.4	Connections with the static theory	637
4.5	Validity of the expansion	640
4.6	Relation between the Hilbert and Chapman-Enskog expansion	645
4.7	Spatially localized data and stationary phase	646
4.8	Behavior of probability amplitudes	649
4.9	The acoustic equations	650
4.10	Dual homogenization formulas	654
4.11	Maxwell's equations	661
4.12	A one-dimensional example	667
5.	<u>The general geometrical optics expansion</u>	
5.1	Expansion for Schrödinger's equation	671
5.2	Eiconal equations and rays	677
5.3	Transport equations	678
5.4	Connections with the static theory	682
5.5	Spatially localized data	684
5.6	Behavior of probability amplitudes	685
5.7	Expansion for the wave equation	685
5.8	Expansion for the heat equation	687
6.	<u>Comments and problems</u>	694
	<u>Bibliography</u>	696
