|                                                                                                                                   |     |
|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>List of contributors</b>                                                                                                       | ix  |
| 1. <b>Orbit counting and the Tutte polynomial</b><br>Peter J. Cameron                                                             | 1   |
| 2. <b>Eulerian and bipartite orientable matroids</b><br>Laura E. Chávez Lomelí and Luis A. Goddyn                                 | 11  |
| 3. <b>Tutte–Whitney polynomials: some history<br/>and generalizations</b><br>Graham E. Farr                                       | 28  |
| 4. <b>A survey on the use of Markov chains to randomly<br/>sample colourings</b><br>Alan Frieze and Eric Vigoda                   | 53  |
| 5. <b>Towards a matroid-minor structure theory</b><br>Jim Geelen, Bert Gerards, and Geoff Whittle                                 | 72  |
| 6. <b>Random planar graphs with given average degree</b><br>Stefanie Gerke, Colin McDiarmid, Angelika Steger,<br>and Andreas Weiß | 83  |
| 7. <b>Fourier analysis on finite abelian groups:<br/>some graphical applications</b><br>Andrew Goodall                            | 103 |
| 8. <b>Flows and ferromagnets</b><br>Geoffrey Grimmett                                                                             | 130 |
| 9. <b>Approximating the Tutte polynomial</b><br>Mark Jerrum                                                                       | 144 |
| 10. <b>Non-separating circuits and cocircuits in matroids</b><br>Bráulio Maia Junior, Manoel Lemos, and Tereza R. B. Melo         | 162 |
| 11. <b>Expanding the Tutte polynomial of a matroid over<br/>the independent sets</b><br>Koko Kalambay Kayibi                      | 172 |

|                                                                 |            |
|-----------------------------------------------------------------|------------|
| <b>12. Connection matrices</b>                                  | <b>179</b> |
| László Lovász                                                   |            |
| <b>13. Complexity of graph polynomials</b>                      | <b>191</b> |
| Steven D. Noble                                                 |            |
| <b>14. Random planar graphs and the number of planar graphs</b> | <b>213</b> |
| Marc Noy                                                        |            |
| <b>15. The contributions of Dominic Welsh to matroid theory</b> | <b>234</b> |
| James Oxley                                                     |            |
| <b>16. On the unknotting problem</b>                            | <b>260</b> |
| Jorge Ramírez Alfonsín                                          |            |
| <b>17. Advances on the Erdős–Faber–Lovász conjecture</b>        | <b>272</b> |
| David Romero and Abdón Sánchez-Arroyo                           |            |
| <b>18. Stochastic set-backs</b>                                 | <b>285</b> |
| David Stirzaker                                                 |            |
| <b>Index</b>                                                    | <b>299</b> |
