## PART 1

1.	MATHEMATICAL ANALYSIS IN GEOGRAPHY AND PLANNING	3
1.1.	Why mathematical analysis is important	3
1.1.1.	The context	3
1.1.2.	Levels of resolution	5
1.1.3.	General aspects of geographical methodology	7
1.2.	The structure of the mathematical argument	10
1.3.	Some examples to be considered in more detail	11
1.3.1.	Introduction	11
1.3.1.	Micro-location theory 1: land use and rent	12
1.3.3.	Micro-location theory 2: plant location and resource use	12
1.3.4.	Location theory via quadrat analysis	13
1.3.5.	Meso-spatial interaction and location theory	13
1.3.6.	Interaction and nodal structure	14
1.3.7.	Network theory 1: descriptive concepts	14
1.3.8.	Network theory 2: shortest paths and flow loading	14
1.3.9.	A note on the concept of 'equilibrium' and 'maximization' in the time development of geographical systems	14
1.3.10.	Diffusion processes	15
1.3.11.	Growth and decline: accounting and time development equations	15
1.3.12.	Process studies: flows and mass or energy balance relationships	16
1.3.13.	Miscellaneous examples	16
2.	ELEMENTARY ALGEBRA AND SYSTEM DESCRIPTION	18
2.1.	Notation and the basic algebraic operations	18
2.2.	Principles of system description	21
2.2.1.	The algebra of space	21
2.2.2.	Further preliminaries	24
2.2.3.	Von Thünen's and Alonso's problems	24
2.2.4.	The Weberian problem	25
2.2.5.	Quadrat analysis	26
2.2.6.	Meso-spatial interaction and location theory	26
2.2.7.	Network theory	27

2.2.8.	Diffusion processes	30
2.2.9.	Accounting and time development	31
2.2.10.	Process studies based on balance relationships	32
2.3.	Relating data to algebraic variables	33
2.4.	Simple equations	34
2.4.1.	Linear equations in one dependent variable	34
2.4.2.	Quadratic equations	37
2.4.3.	Cubic and higher order equations	39
2.4.4.	Checking that equations make sense	40
2.5.	Simultaneous equations – more than one dependent variable	40
2.6.	Inequalities	43
2.7.	Some simple series	
2.7.1.	The arithmetic progression	45
2.7.2.	The geometric progression	46
3.	<b>FUNCTIONS, GRAPHS, CO-ORDINATE GEOMETRY, AND MORE EQUATIONS</b>	54
3.1.	Introduction	54
3.2.	Some formal definitions and general notation	54
3.2.1.	Definition of a function	54
3.2.2.	Notation	56
3.2.3.	Implicit and inverse functions	56
3.3.	Graphs and co-ordinate geometry	57
3.3.1.	Graphs	57
3.3.2.	The geometry of the straight line	59
3.3.3.	The intersection of two straight lines	61
3.3.4.	The distance between two points	64
3.3.5.	Equations of particular straight lines	64
3.3.6.	The interpretation of linear inequalities	66
3.4.	The standard functions	68
3.4.1.	Introduction	68
3.4.2.	The power function	68
3.4.3.	The logarithmic function	71
3.4.4.	The exponential function	74
3.4.5.	Trigonometric functions	75
3.4.6.	Inverse trigonometric functions	78
3.5.	A wider range of functions	79
3.5.1.	Introduction	79
3.5.2.	Polynomial and rational functions, graphical solution of equations	79
3.5.3.	The hyperbolic functions	81
3.5.4.	The logistic function, and a note on asymptotes	83
3.5.5.	Miscellaneous examples	84
3.6.	Series expansion of functions	85
3.7.	Functions of more than one independent variable	87
3.7.1.	Notation and examples	87
3.7.2.	Higher dimensional co-ordinate geometry	88
3.8.	More examples of equations, functions and associated algebraic manipulation	89

3.8.1.	Introduction	89
3.8.2.	Infiltration rates	90
3.8.3.	Scree slopes	92
3.8.4.	Horton's network laws	92
3.8.5.	A simple population model	95
3.8.6.	von Thünen's rings	96
3.8.7.	Meso-spatial interaction and location models	98
3.8.8.	Diffusion from a polluting source	105
4.	MATRIX ALGEBRA	110
4.1.	Definitions	110
4.2.	The basic operations of matrix algebra	112
4.3.	Linear simultaneous equations in matrix form	116
4.4.	Matrices and linear transformations	120
4.4.1.	Rotations	120
4.4.2.	Linear transformations of vectors and matrices	122
4.4.3.	Canonical forms, eigenvalues and eigenvectors	124
4.5.	Examples of the use of matrices	124
4.5.1.	The analysis of nodal structure	124
4.5.2.	An account-based population model	126
4.5.3.	The input-output model	129
5.	CALCULUS	136
5.1.	Introduction	136
5.2.	The basic concepts of differential calculus	137
5.2.1.	The gradient as a limit	137
5.2.2.	Notation and main concepts	138
5.2.3.	The sign of the derivative, and a preliminary note on a maxima and minima	140
5.3.	Derivatives of standard functions	140
5.4.	Rules for differentiating non-standard functions	142
5.4.1.	Introduction	142
5.4.2.	Scalar multiples	142
5.4.3.	The sum of two functions	143
5.4.4.	Function of a function	143
5.4.5.	Differentiation of a product	144
5.4.6.	Differentiation of a quotient	145
5.4.7.	Differentiation of a parametrically specified function	146
5.4.8.	The 'rules' in combination	146
5.4.9.	Differentiation in practice	147
5.5.	Second and higher order derivatives	147
5.6.	Maxima, minima and points of inflexion	148
5.7.	The basic concepts of integral calculus	151
5.7.1.	Integral calculus as the inverse of differential calculus	151
5.7.2.	Integrals as areas under curves	151
5.7.3.	An interpretation of the integral notation	154
5.7.4.	Integration of standard functions	154

5.8.	Some methods for integrating non-standard functions	155
5.8.1.	Integration by substitution	155
5.8.2.	Integration by parts	156
5.9.	Calculus of functions of several variables	157
5.9.1.	Partial differentiation	157
5.9.2.	Estimation of a 'best fitting' straight line	159
5.9.3.	Weber's problem	162
5.9.4.	Multiple integration	164
5.10.	Series expansions and the mean value theorem	164
5.10.1.	Taylor's theorem	164
5.10.2.	Maclaurin's theorem	165
5.10.3.	Series expansion by the differentiation and integration of known series	166
5.10.4.	The mean value theorem	166
5.10.5.	A word of caution on series expansions	169
5.11.	Some examples	169
5.11.1.	Introduction	169
5.11.2.	Population models	169
5.11.3.	The intervening opportunities' model	171
5.11.4.	Error propagation in photogrammetry	172
5.11.5.	Consumers' surplus	173
5.11.6.	Total population given a density distribution	176
5.11.7.	A continuous space model of spatial interaction	178
<b>PART 2</b>		
6.	<b>DIFFERENTIAL AND DIFFERENCE EQUATIONS</b>	187
6.1.	Definitions	187
6.2.	Ordinary differential equations	187
6.2.1.	Introduction	187
6.2.2.	Solution by inspection	188
6.2.3.	First-order linear differential equations	189
6.2.4.	Particular solutions	191
6.3.	Ordinary linear differential equations	193
6.3.1.	Introduction	193
6.3.2.	Constant coefficients: $F(x) = 0$	193
6.3.3.	Constant coefficients: $F(x) \neq 0$	195
6.3.4.	Non-constant coefficients; solution in series	196
6.3.5.	Iterative solutions	198
6.4.	Finite differences	200
6.4.1.	Introduction	200
6.4.2.	Differentiation and integration using finite differences	202
6.5.	Difference equations	205
6.5.1.	Relation to differential equations	205
6.5.2.	Linear difference equations with constant coefficients	206
6.6.	Some examples of ordinary differential and difference equations	209
6.6.1.	Hillslope profile development with a steadily down-cutting river	209

6.6.2.	Freezing of water in a lake or in a uniform soil from above	210
6.6.3.	Length probabilities for a queue in a steady state	212
6.7.	Partial differential equations	214
6.7.1.	Some contexts and examples	214
6.7.2.	The continuity equation in one-dimension	215
6.7.3.	Hillslope profile development	216
6.7.4.	Saturated water flow	218
6.7.5.	Unsaturated infiltration of soil water	219
6.7.6.	Glacier flow	220
6.7.7.	Heat conduction in the ground	221
6.7.8.	Diffusion processes	222
6.7.9.	Types of solution of the continuity equation	223
6.7.10.	Steady state solutions	224
6.7.11.	Separation of variables	225
6.7.12.	Laplace transform solutions	227
6.7.13.	Kinematic wave solutions	228
6.7.14.	Some examples of solutions for $\frac{\partial^2 z}{\partial x^2} = \frac{K \partial z}{\partial t}$	232
7.	THE MATHEMATICS OF PROBABILITY AND STATISTICS	244
7.1.	Introduction	244
7.2.	Basic definitions	244
7.2.1.	Randomness and probability	244
7.2.2.	Adding probabilities: exclusive and exhaustive events	246
7.2.3.	Multiplying probabilities: conditional probability and independence	247
7.3.	Examples of simple probabilities	248
7.3.1.	Coin tossing	248
7.3.2.	Examples of real-world data: the relation to statistics	250
7.4.	Compound probabilities; the binomial distribution	255
7.4.1.	Probability distributions	255
7.4.2.	The binomial distribution	256
7.4.3.	Stirling's formula	258
7.5.	Moments of distributions	259
7.5.1.	Definitions	259
7.5.2.	Moments of the binomial distribution	260
7.6.	Limiting cases of the binomial distribution	261
7.6.1.	Introduction	261
7.6.2.	The Poisson distribution	261
7.6.3.	The normal distribution	263
7.6.4.	The central limit theorem	263
8.	STOCHASTIC PROCESSES	268
8.1.	Random walks	268
8.1.1.	Introduction	268
8.1.2.	The binomial process	268

8.1.3.	The ballot theorem	26
8.1.4.	Returns to zero	27
8.1.5.	Examples of random walks	27
8.1.6.	Stream networks as random walks	27
8.1.7.	Gambler's ruin : absorbing and reflecting barriers	27
8.1.8.	The effect of base level : a geomorphological example	27
8.2.	Markov chains	280
8.2.1.	Definition	280
8.2.2.	Change in probabilities over time	281
8.2.3.	Distribution after long times	282
8.2.4.	Other types of chain	284
8.3.	Poisson processes	284
8.3.1.	Derivation	284
8.3.2.	Spacing of occurrences	285
8.3.3.	Nearest neighbour statistics	286
8.3.4.	Other examples of Poisson processes	288
8.4.	Branching processes	288
8.4.1.	Introduction	288
8.4.2.	Generating function for number in each generation	288
8.4.3.	Extinction probabilities	290
8.5.	Other stochastic processes	291
8.5.1.	Types of stochastic process	291
8.5.2.	Birth and death processes	292
9.	MAXIMIZATION AND MINIMIZATION METHODS	297
9.1.	Introduction	297
9.2.	Constrained maximization	298
9.2.1.	The Lagrangian method	298
9.2.2.	Example 1: utility maximizing and profit maximizing	303
9.2.3.	Example 2: entropy maximizing models	306
9.2.4.	A note on maximum likelihood methods	311
9.3.	The 'calculus of variations' method for finding optimum paths	311
9.3.1.	The problem and the method	311
9.3.2.	Minimum distance and time paths	313
9.4.	Algorithmic mathematics	317
9.4.1.	Introduction	317
9.4.2.	The shortest path through a network	317
9.4.3.	Linear programming	321
10.	CATASTROPHE THEORY AND BIFURCATION: NEW METHODS FOR DYNAMIC MODELLING	329
10.1.	Introduction	329
10.2.	System description	329
10.3.	Catastrophe theory	334
10.3.1.	Introduction	334
10.3.2.	The fold catastrophe	334
10.3.3.	The cusp catastrophe	335

10.3.4.	The deeper theorems of catastrophe theory	338
10.3.5.	Example 1: retail centres of varying size	340
10.3.6.	Example 2: modal choice and the cusp catastrophe	343
10.3.7.	Example 3: location theory and a non-canonical cusp	344
10.3.8.	Other geographical applications	349
10.4.	A framework for the development of dynamic models	350
10.5.	Differential equations and bifurcation	350
10.5.1.	Dynamical systems as differential equations	350
10.5.2.	Typical forms of solution of dynamic differential equations	351
10.5.3.	Example 1: growth equations	354
10.5.4.	Example 2: the Lotka-Volterra prey-predator equations	356
10.5.5.	Example 3: competition for fixed resources	358
10.6.	Applications in planning	360
11.	<b>PROBLEM SOLVING METHODS</b>	363
11.1.	Introduction: types of problem solving	363
11.2.	Model building methods: a summary	364
11.3.	Concluding comments	365
	<b>REFERENCES</b>	367
	<b>ANSWERS TO EXERCISES</b>	375
	<b>INDEX</b>	399
