

CONTENTS

Foreword to the Czech Edition	xvii
Foreword to the English Edition	xviii

I. Atomic Structure and the Fundamentals of Quantum Mechanics

A. Atomic Structure

1. Determination of specific charge of electron from deflection in magnetic field	1
2. Determination of electronic charge	5
3. Determination of neutron mass from nuclear photoeffect in heavy hydrogen	8
4. Determination of wave-length of electron from diffraction on grating	10
5. Determination of positron mass	13
6. Photoelectric effect—calculation of characteristic frequency and Planck constant	14
7. Compton effect—shift in wave-length of X-rays	16
8. Spectral distribution of black-body radiation	19
9. Determination of atomic number by means of X-ray spectra	21
10. Calculation of wave-length of lines of Balmer series of hydrogen	24
11. Determination of isotopes by means of electronic spectra	26
12. Calculation of electronic mass from Rydberg constants of hydrogen and helium	28
13. Calculation of critical potentials of helium from spectroscopic data	29
14. Rate of radioactive disintegration and radioactive equilibrium	31
15. Estimation of radioactive constant by Geiger-Nuttall rule	34

B. The Fundamentals of Quantum Mechanics	
1. Calculation of translational partition function of ideal gas	36
2. Rotational partition function of carbon monoxide	39
3. Vibrational partition function of hydrogen chloride	43
Problems	46
Results	53
II. Kinetic Theory of Ideal Gas	
1. Calculation of molecular velocities	56
2. Calculation of molar heat capacity	57
3. Mean free path	58
4. Collision diameter of molecules	60
5. Collision diameter and diffusion coefficient	63
6. Determination of molecular weight from effusion of gas	64
7. Determination of vapour pressure by effusion method	67
Problems	69
Results	71
III. Ideal Gas	
1. Boyle's Law	73
2. Gay-Lussac's law and the absolute temperature scale	74
3. Ideal gas equation—calculation of volume	77
4. Ideal gas equation—calculation of molecular weight	78
5. Determination of molecular weight by method of limiting densities	79
6. Ideal gas equation—degree of dissociation	81
7. Calculation of degree of association from molecular weights	83
8. Expression of concentration of gas mixtures	85
9. Calculation of total pressure of gas mixture from Dalton's law	87
10. Calculation of partial pressure from Dalton's law	89
Problems	91
Results	94

IV. Fundamentals of Thermodynamics

A. First Law of Thermodynamics

1. Calculation of units	96
2. Calculation of change in internal energy during evaporation	97
3. Calculation of specific and atomic heat capacities from calorimetric data	98
4. Dependence of molar heat capacity on temperature	100
5. Calculation of heat of reaction from heats of formation	101
6. Calculation of standard heat of formation from known heats of reaction	102
7. Calculation of heat of reaction from heats of combustion	103
8. Calculation of standard heats of formation from bond energies	104
9. Dependence of standard heat of reaction on temperature	106
10. Enthalpic balance	108
11. Theoretical flame temperature	110
12. Work during isothermal process	112
13. Heat, work and change in internal energy during expansion of ideal gas	113
14. Adiabatic process	115
15. Work done during adiabatic process	116
16. Thermal engine	119
17. Cooling engine	120
Problems	121
Results	131

B. Second Law of Thermodynamics

1. Dependence of entropy on pressure	133
2. Dependence of entropy on temperature	135
3. Graphical calculation of entropy change with temperature	136
4. Entropy of mixing	139
5. Entropy change during irreversible adiabatic process	140
6. Isothermal change in free energy and free enthalpy of ideal gas	142
7. Dependence of free enthalpy on pressure	143

8. Change in free enthalpy during isomorphous transformations	144
9. Change in free enthalpy in irreversible phase transformations	144
10. Thermodynamic functions of ideal gas	145
Problems	147
Results	149
V. States of Matter	
A. Real Gases	
1. Calculation of volume from Berthelot equation	151
2. Calculation of volume from Beattie-Bridgeman equation	152
3. Calculation of density from generalized compressibility diagram	154
4. Comparison of van der Waals equation with generalized compressibility factor	156
5. Calculation of temperature from generalized compressibility diagram	158
6. Determination of second virial coefficient by method of limiting densities	160
7. Beattie-Bridgeman equation for mixture of gases	162
8. Calculation of pressure of gas mixture using generalized compressibility diagram	163
9. Joule-Thomson coefficient	165
10. Dependence of molar heat capacity on pressure	168
11. Difference in molar heat capacities $c_p - c_v$ for real gas	170
12. Calculation of fugacity by analytical method	172
13. Calculation of fugacity of constituent in mixture	174
Problems	176
Results	182
B. Liquids	
1. Calculation of density using generalized expansion factor	183
2. Calculation of surface tension from capillary rise	185
3. Eötvös equation	186

4. Calculation of viscosity from Poiseuille equation	188
5. Stokes' law	189
Problems	191
Results	192
C. Solids	
1. Determination of constants of ionic lattice from diffraction of X -rays	192
2. Estimation of molar heat capacity of solid means of Kopp's law	194
3. Determination of temperature dependence of molar heat capacities of solids from known characteristic temperature	196
4. Calculation of molar heat capacities of solids on basis of Born-Kármán theory	198
5. Calculation of characteristic temperature from compressibility	201
6. Calculation of characteristic temperature from melting point	202
Problems	203
Results	205
VI. Phase Equilibrium	
A. Systems with One Component	
1. Clapeyron equation—calculation of change in melting point with pressure	206
2. Clapeyron equation—graphical calculation of heat of fusion	207
3. Clausius-Clapeyron equation—calculation of change in boiling point with pressure	208
4. Clausius-Clapeyron equation—calculation of triple point	209
5. Calculation of heat of vaporization from empirical equation for temperature dependence of vapour pressure	210
6. Ramsay-Young rule	212
7. Cox-Othmer diagram	214
8. Adjustment of measured values of vapour pressure by method of least squares	216
9. Cailletet-Mathias law—determination of critical volume	218

B. Systems with Several Components	
1. Units of concentration	221
2. Partial molar volumes—analytical calculation from apparent molar volumes	222
3. Partial molar volume—graphical calculation from apparent molar volumes	224
4. Calculation of partial molar enthalpy from heats of mixing	226
5. Calculation of solubility of gases by means of Henry's law	229
6. Bunsen and Ostwald absorption coefficients	230
7. Temperature dependence of solubility of gases in liquids	231
8. Vapour-liquid equilibrium in ideal solution at constant temperature	233
9. Vapour-liquid equilibrium in ideal system at constant pressure	235
10. Vapour-liquid equilibrium in real systems	237
11. Dependence of composition of azeotropic mixture on pressure	240
12. Determination of number of theoretical plates of distillation column	243
13. Calculation of activity of constituents in solutions of non-electrolytes	244
14. Steam distillation	246
15. Solubility in ideal solution	247
16. Nernst distribution law	248
17. Phase diagrams	250
C. Colligative Properties	
1. Lowering of vapour pressure above solution	252
2. Calculation of degree of association from cryoscopic measurements	253
3. Determination of molecular weight by ebullioscopic method	255
4. Osmotic pressure	257
Problems	258
Results	269

VII. Chemical Equilibrium and Third Law of Thermodynamics

A. Chemical Equilibrium

1. Calculation of equilibrium constant from equilibrium composition of gas mixture	271
2. Calculation of equilibrium composition of gas mixture from equilibrium constant	273
3. Calculation of degree of dissociation	275
4. Calculation of equilibrium constant from equilibrium conversion data	276
5. Dependence of equilibrium constant on stoichiometric form of equation	277
6. Calculation of equilibrium constant of homogeneous gas reaction from high-pressure equilibrium data	278
7. Calculation of equilibrium constant of reaction in solution	281
8. Calculation of equilibrium constant from change in standard free enthalpy	283
9. Calculation of free enthalpy of reaction from tabulated data	285
10. Calculation of standard free enthalpies of formation from tabulated data	286
11. Graphical computation of temperature dependence of equilibrium constant	287
12. Temperature dependence of free enthalpy of reaction	290
13. Determination of heat of reaction from temperature dependence of equilibrium constant	292
14. Calculation of decomposition temperature from temperature dependence of equilibrium pressure	296
15. Influence of temperature and pressure on equilibrium conversion	299
16. Calculation of equilibrium yield of reaction from thermal data of partial processes	302
17. Calculation of equilibrium composition for simultaneous reaction	303
B. Third Law of Thermodynamics	
1. Calculation of equilibrium conversion from tabulated data of $(\mathcal{G}^0 - \mathcal{H}_0^0)/T$ and $\Delta \mathcal{H}_0^0$; effect of inert gas on equilibrium conversion	307
2. Calculation of absolute entropy from calorimetric data	312

3. Statistical calculation of thermodynamic functions of monatomic gas	317
4. Calculation of thermodynamic functions of polyatomic molecule from spectroscopic data	320
Problems	326
Results	338

VIII. Electrochemistry

A. Transport Phenomena

1. Calculation of current intensity from Faraday's law	340
2. Transference numbers	341
3. Calculation of cell constant and specific conductivity of solution	345
4. Calculation of equivalent conductivity from specific conductivity of solution	346
5. Kohlrausch law of independent migration of ions	347
6. Determination of purity of water from conductivity measurements	349
7. Calculation of solubility of slightly soluble salt from conductivity measurements	351
8. Calculation of dissociation constant from conductivity measurements	352

B. Ionic Equilibria

1. Calculation of activity coefficient from Debye-Hückel law	355
2. Calculation of activity coefficients from cryoscopic data	357
3. Solubility product of sparingly soluble salt	361
4. Calculation of activity coefficient from solubility data	364
5. Calculation of second dissociation constant	367
6. Calculation of degree of hydrolysis of salt of strong acid and weak base	370
7. Calculation of degree of hydrolysis of salt of weak acid and weak base	373

C. Galvanic Cells

1. Calculation of pH of solution from e. m. f.'s	375
2. Calculation of standard potential of electrode from dependence of e. m. f. of cell on concentration of electrolyte	377

3. Calculation of transference number and liquid, junction potential from e. m. f. of concentration cell	380
4. Calculation of solubility product from e. m. f.	384
5. Calculation of dissociation constant of weak acid from e. m. f.	386
6. Calculation of standard reduction-oxidation potential of system $\text{ReO}_4^-/\text{ReO}_2$	389
7. Calculation of equilibrium constant by means of Luther's relation	392
8. Gibbs-Helmholtz equation in electrochemistry	394
Problems	396
Results	403

IX. Reaction Kinetics

A. Chemical Kinetics

1. Determination of order of reaction by numerical method	405
2. Determination of order of reaction from the time of half-change	407
3. Determination of order of reaction by differential method	411
4. Kinetics of pseudo-unimolecular reaction	413
5. Kinetics of side reactions	416
6. Kinetics of consecutive processes	420
7. Opposing reactions	426
8. Time dependence of composition in complicated reaction system	428
9. Calculation of activation energy of reaction from temperature dependence of rate constant	432
10. Determination of activation energy and frequency factor of homogeneous gas reaction by graphical method	433
11. Calculation of rate constant by means of collision theory	436
12. Rate constant of reaction expressed in different units	438
13. Enthalpy of activation, entropy of activation and correlation of kinetic data	440

14. Calculation of temperature dependence of equilibrium constant from enthalpies and entropies of activation of opposing reactions	443
15. Calculation of volume of flow reactor	445
16. Determination of mechanism of chain reaction	448
17. Kinetics of complex chain reaction	451
18. Order of homogeneous catalyzed reaction	454
19. Dependence of rate of ionic reaction on ionic strength	457
20. Kinetics of heterogeneous catalyzed reaction	461
21. Quantum yield of photochemical reaction	463
B. Kinetics of Physical Processes	
1. Fick's law and relative determination of diffusion coefficient	466
2. Rate of dissolution of solid in liquid	471
3. Kinetics of flow of liquids through porous medium	475
Problems	477
Results	487
X. Surface Phenomena and Colloidal Systems	
A. Surface Phenomena	
1. Graphical determination of constants of Langmuir adsorption isotherm	490
2. Determination of surface area of solids by Brunauer, Emmett and Teller method	492
3. Determination of heat of adsorption from isosteres	495
4. Calculation of amount adsorbed according to Gibbs equation	499
5. Determination of molecular weight of high-molecular substance from pressure measurement of surface monolayer	502
B. Colloidal Systems	
1. Determination of Avogadro number from measuring sedimentation equilibrium in gravitational field	504
2. Determination of molecular weight of high-molecular compounds by measuring sedimentation equilibrium in ultracentrifuge	507

3. Determination of molecular weight of high-molecular compounds from sedimentation velocity in ultracentrifuge	509
4. Sedimentation analysis	512
5. Determination of molecular weight of high-molecular substance from measurements of viscosity	519
6. Determination of molecular weight of high-molecular substance by light scattering	522
Problems	525
Results	530
 XI. Molecular Structure and Physical Properties	
1. Neumann-Kopp law	531
2. Parachor	532
3. Molar refraction	534
4. Molar refraction—optical anomaly	536
5. Dipole moment of gas	537
6. Calculation of dipole moment from dielectric constants of solution	539
7. Polarimetry	542
8. Beer's law	544
9. Determination of internuclear distances from micro-wave spectrum	545
Problems	547
Results	550
Tables	551
Index	599
